

# How to use interferometric data for landslide risk management

Lorenzo Solari <sup>1</sup>

<sup>1</sup> University of Firenze,  
Department of Earth Sciences

Athens, 04/06/2019

“This work has been funded by the European Commission, Directorate-General Humanitarian Aid and Civil Protection (ECHO), through the project U-Geohaz (UCPM-2017-PP-AG -783169).”

# Aims & contents

- Present a methodology for landslide impact evaluation based on interferometric data, developed in the framework of U-Geohaz project
- Present the results of a 3-years monitoring project based on Sentinel-1 data, focusing on data management for Civil Protection aims

# Satellite interferometry- based landslide impact assessment – an example from Valle d’Aosta Region

# Valle d'Aosta region

Surface = 3260 sqkm

Population = 126.687

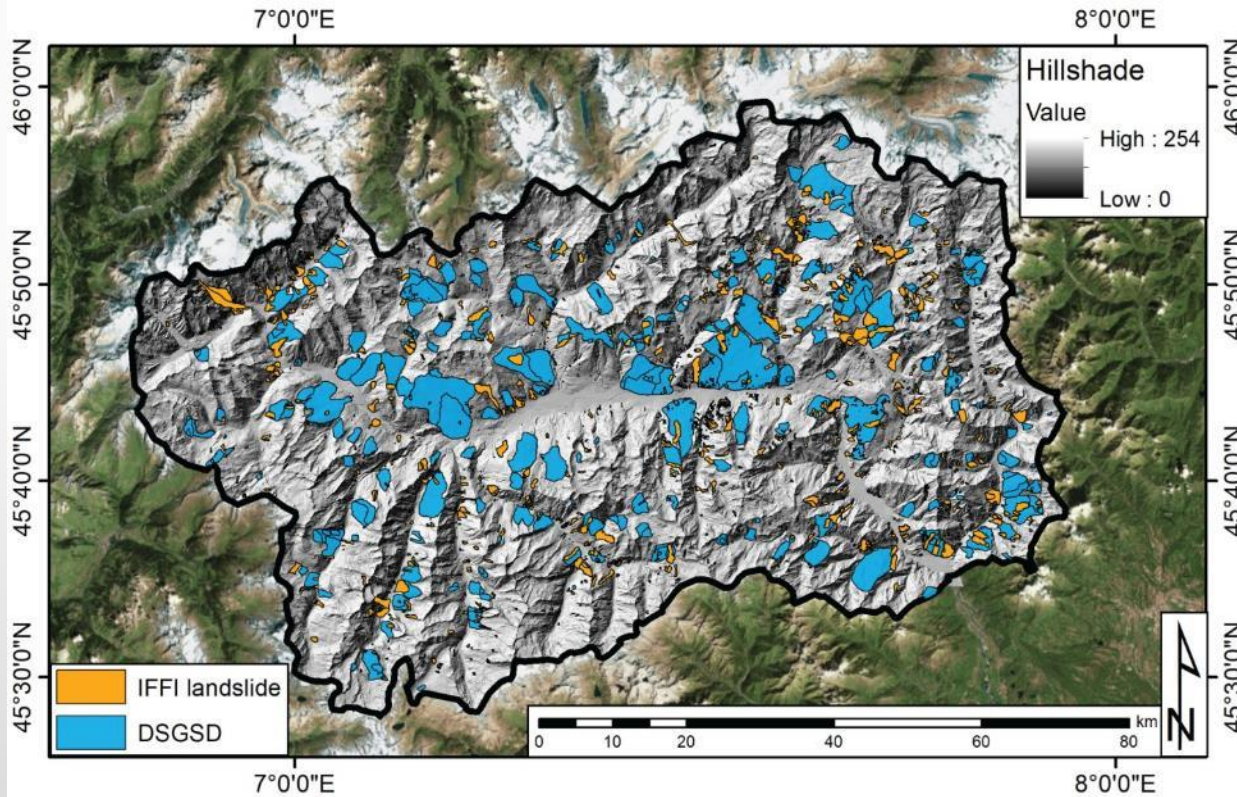

Municipalities = 74

>50% of the territory is  
above 2000 m a.s.l.

# Valle d'Aosta – Landslide risk

4400 landslides

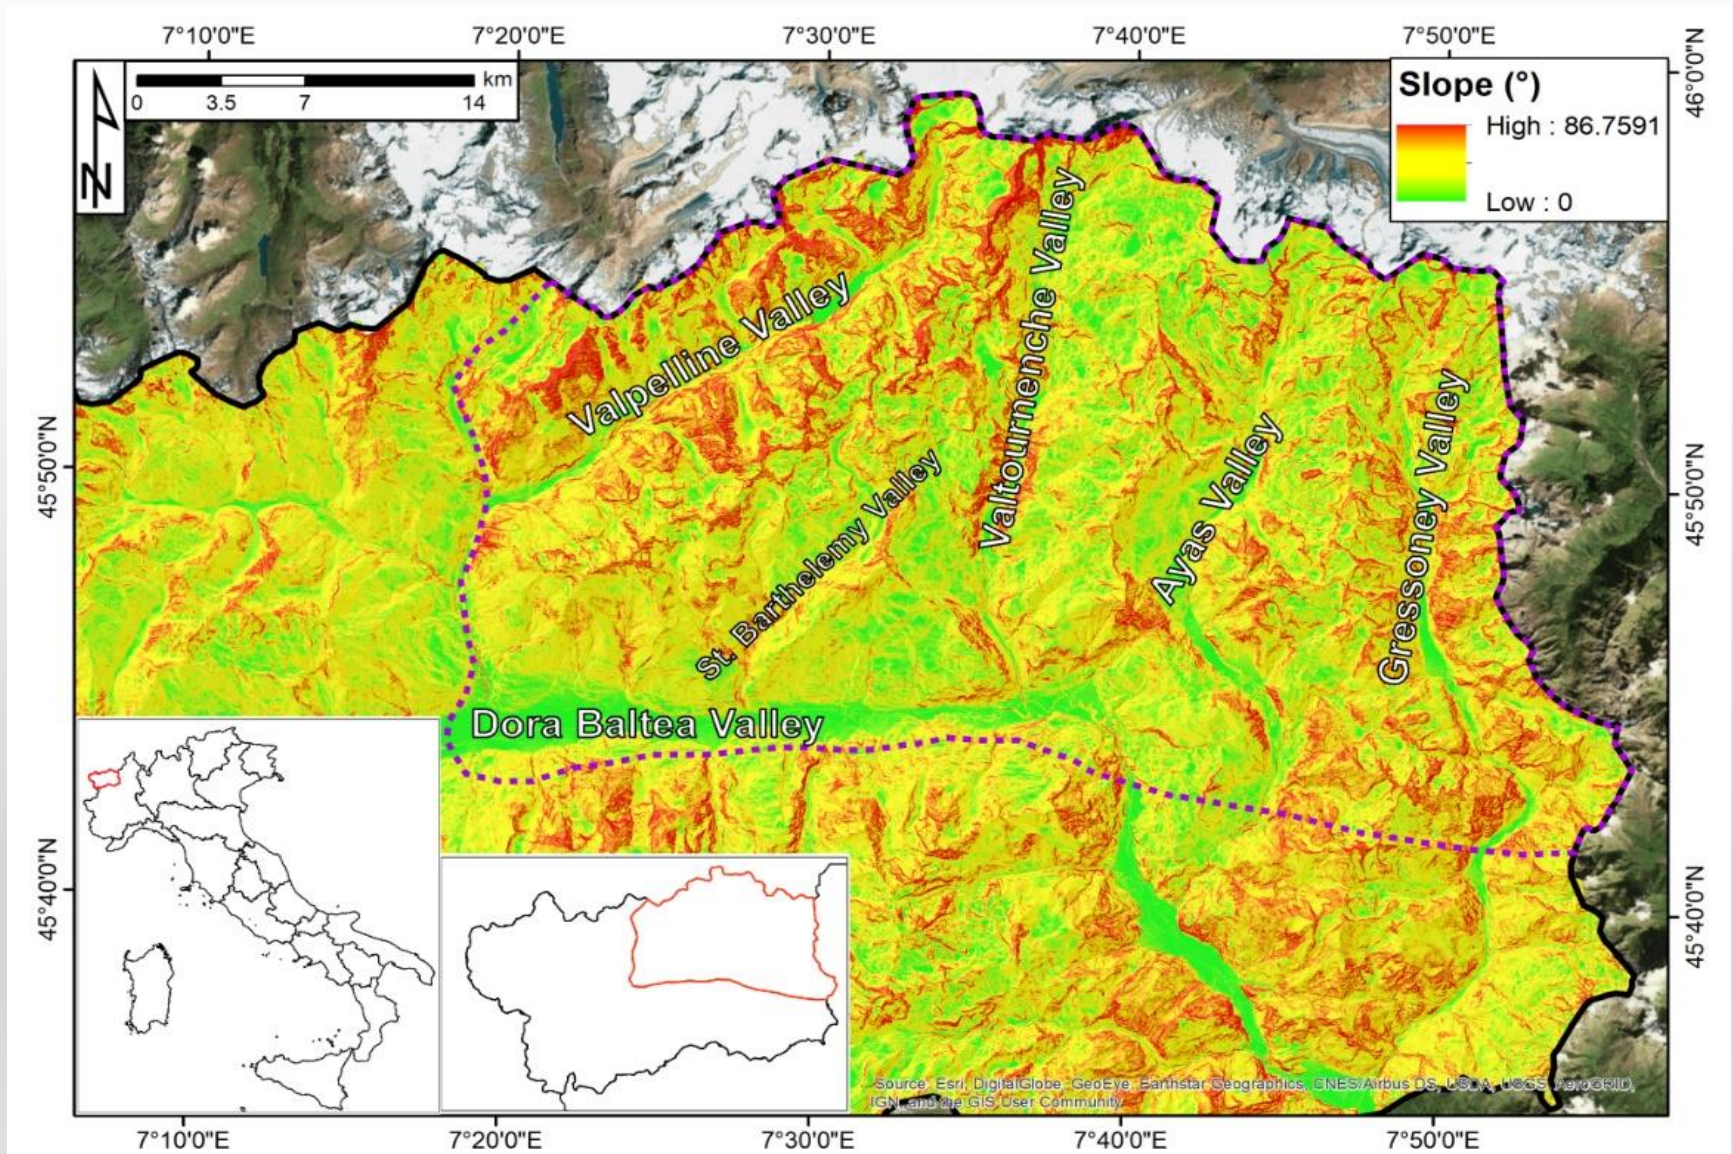

134 landslides/100 sqkm

520 sqkm affected by  
landslides (16% of the total)

Rockfalls, complex and  
rotational landslides are  
common

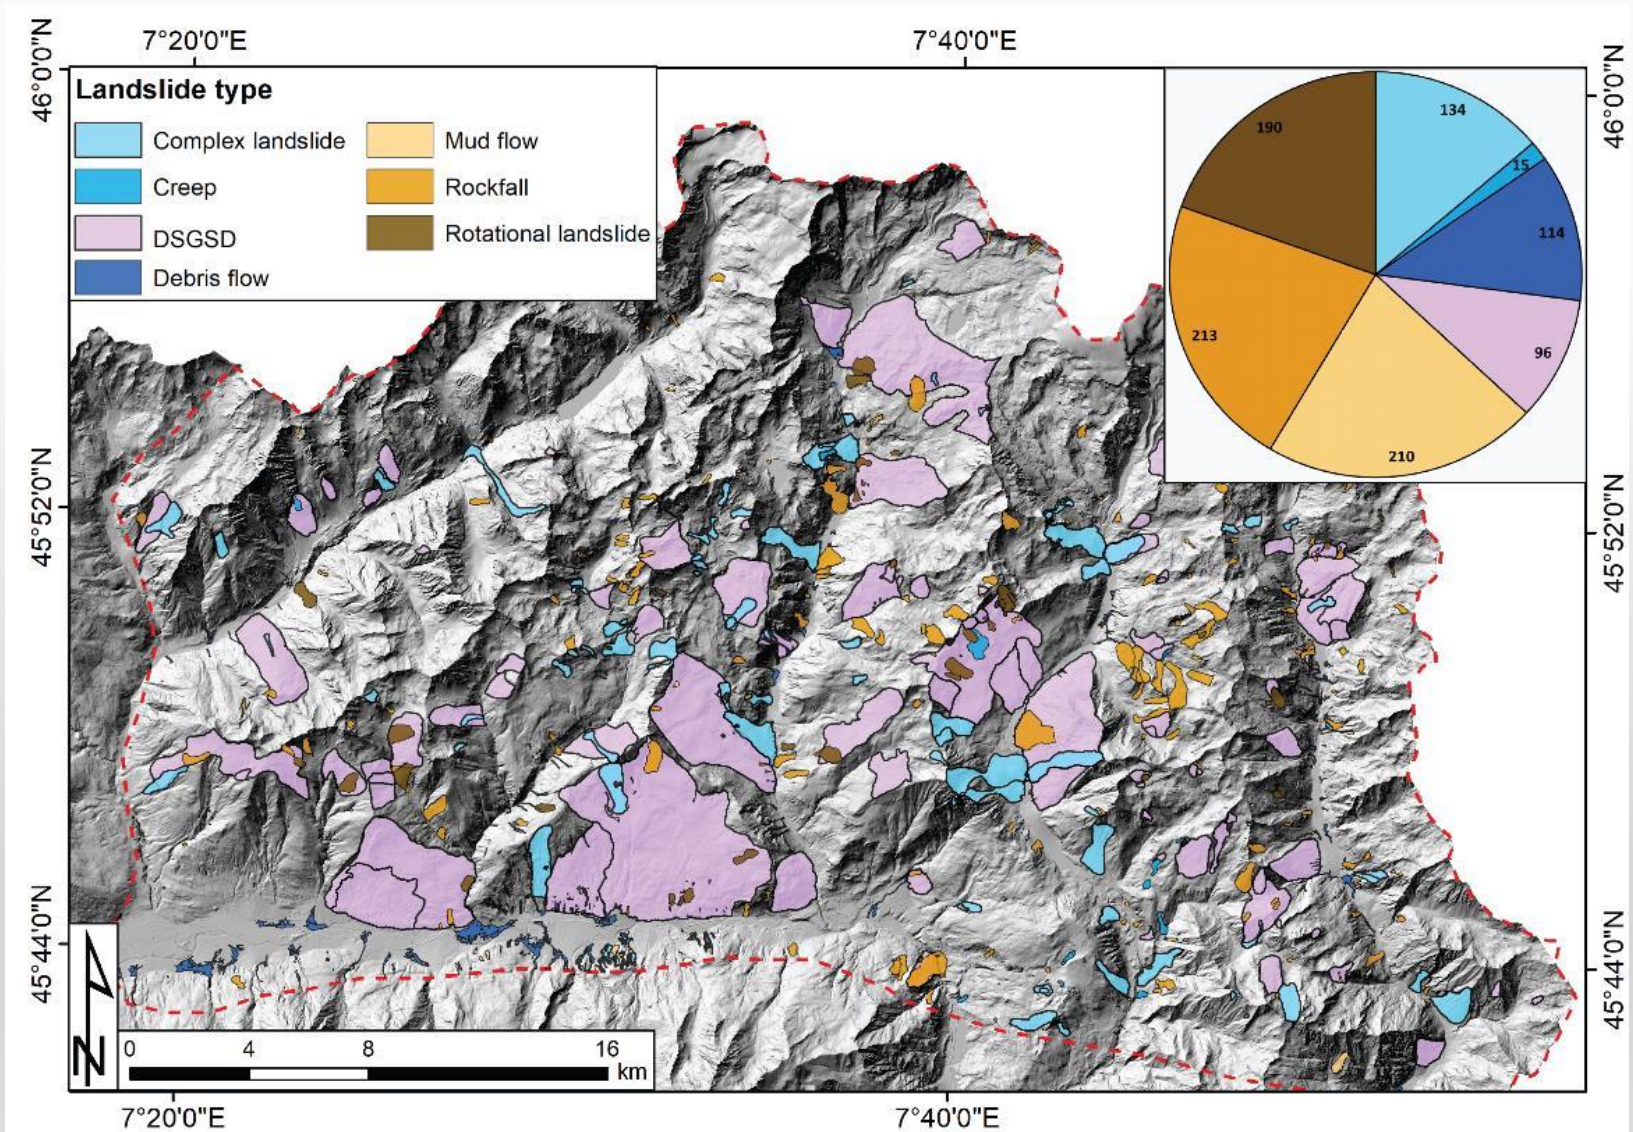

# Test area – NE Valle d'Aosta

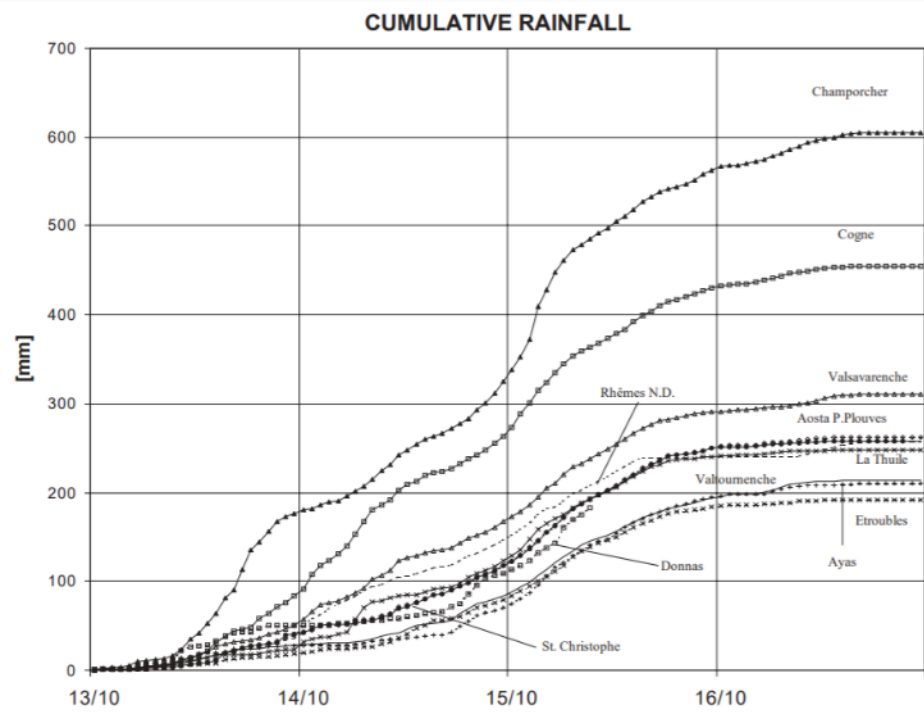

# Test area – NE Valle d'Aosta

Landslide index = 20%, some DSGSD cover more than 10 km<sup>2</sup>

# Test area – Past events

13 to 16 October 2000 rainfalls:  
385 landslides - 259 debris flows  
17 people died  
500 millions euros lost

# General concept

- Interferometric data are the core of the methodology and the starting point
- The final output should be a color-scale map showing «numbers» for each element at risk → quantitative estimation
- The methodology should work at regional scale with limited ancillary data
- The methodology should use common GIS tools or open-source software
- The methodology should be fast to apply

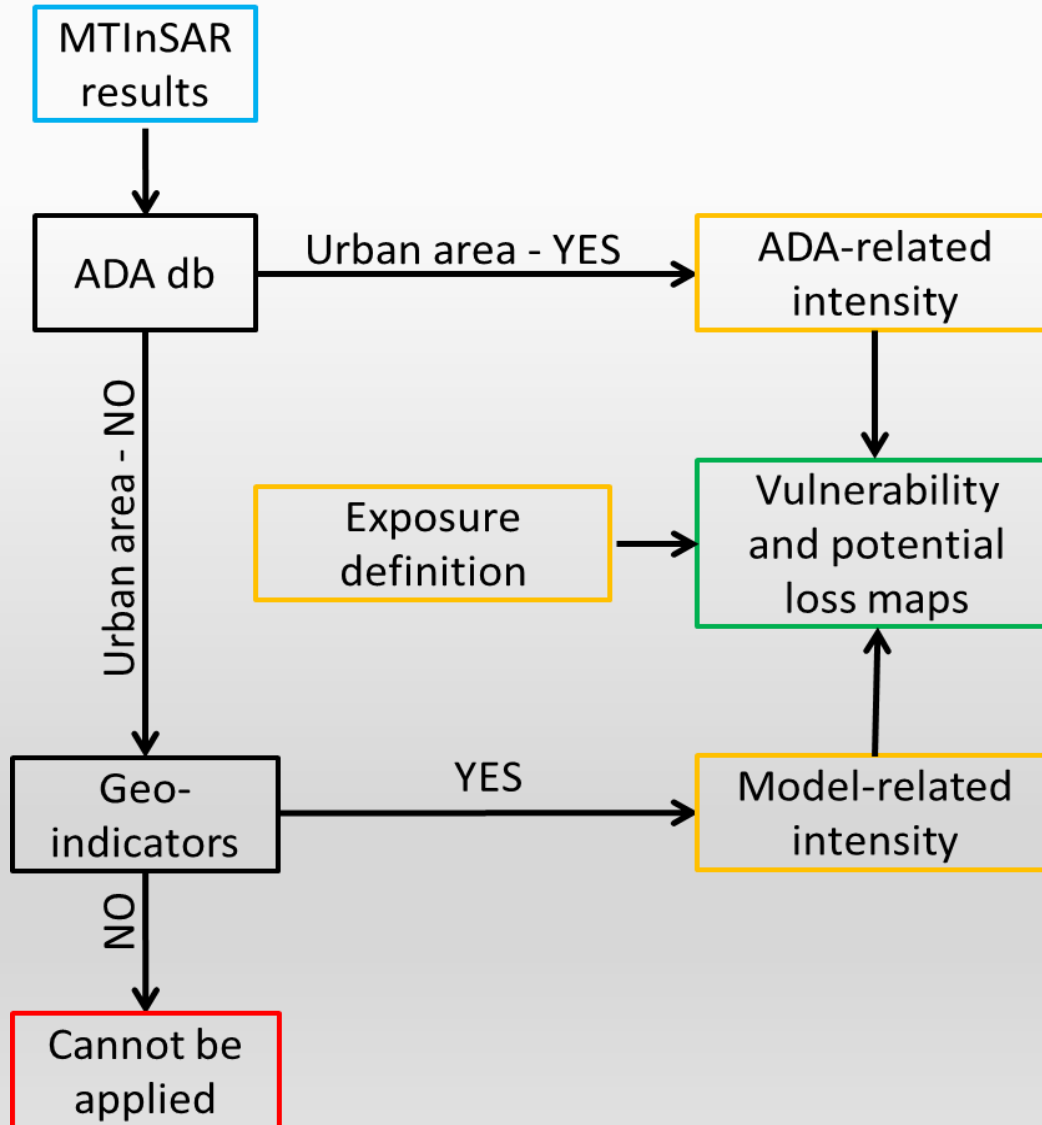

# Some definitions

- **Vulnerability**: degree of loss of a given element at risk to the occurrence of a landslide of a given magnitude (Corominas et al., 2014)
- **Exposure**: a characteristic of the element at risk (person or structure) and it is referred to its location and economic value (Glade and Crozier, 2005)
- **Intensity**: an evaluation of landslide destructiveness (Hungri, 1997)
- **Potential loss** (or worth of losses): product between vulnerability (as a function of intensity) and exposure (Catani et al., 2005)

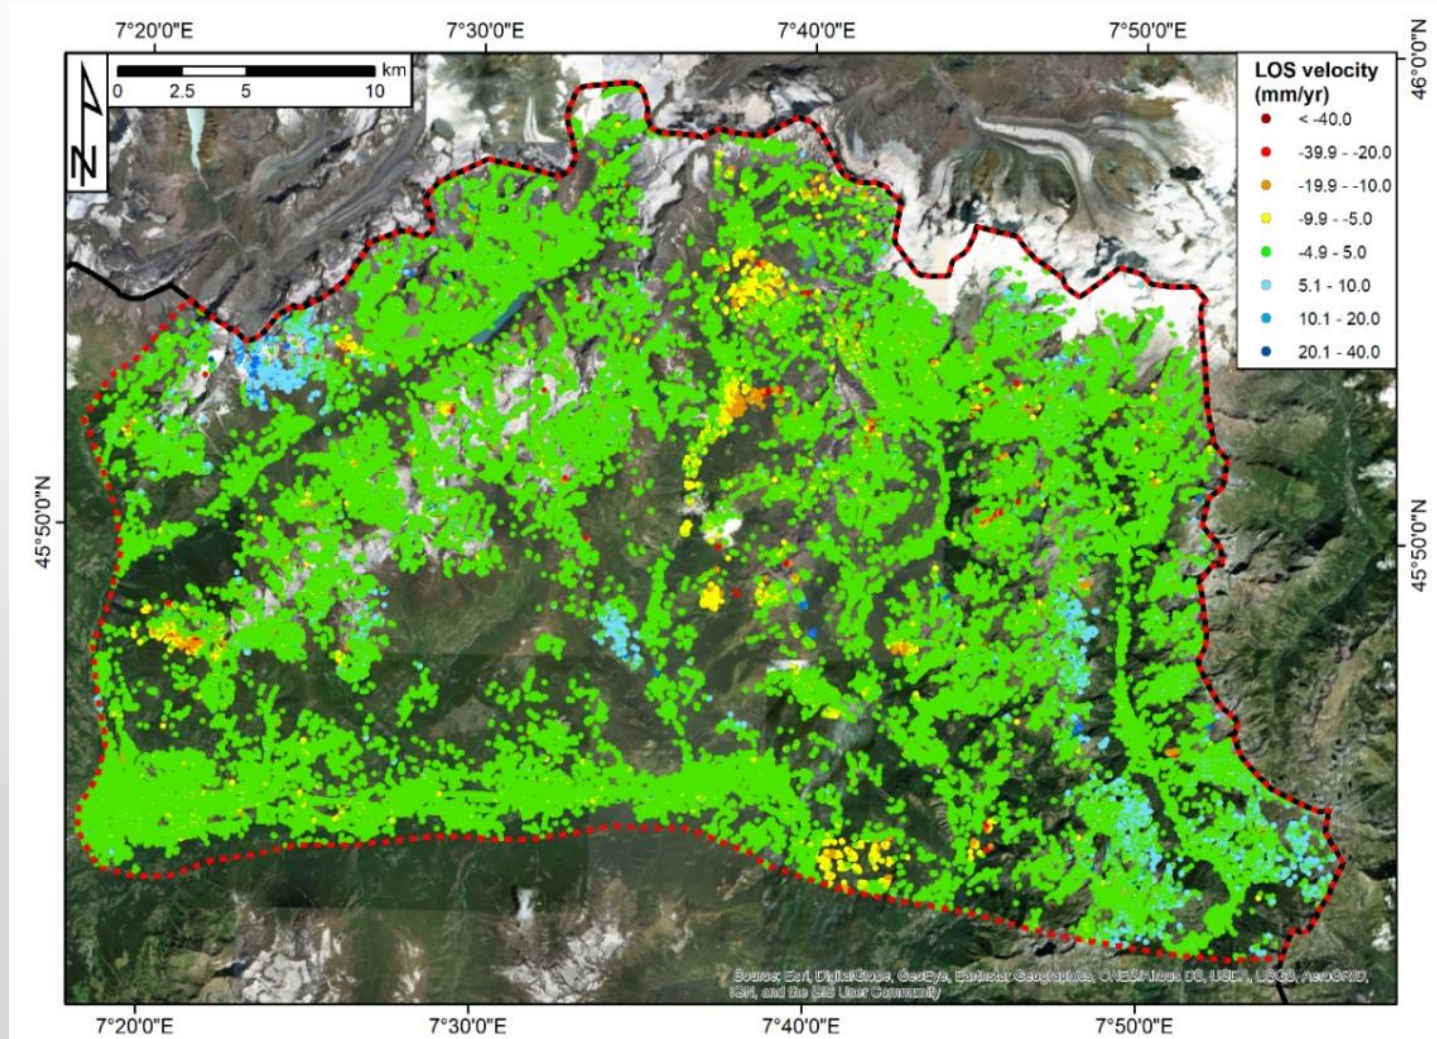

# Work flow of the methodology

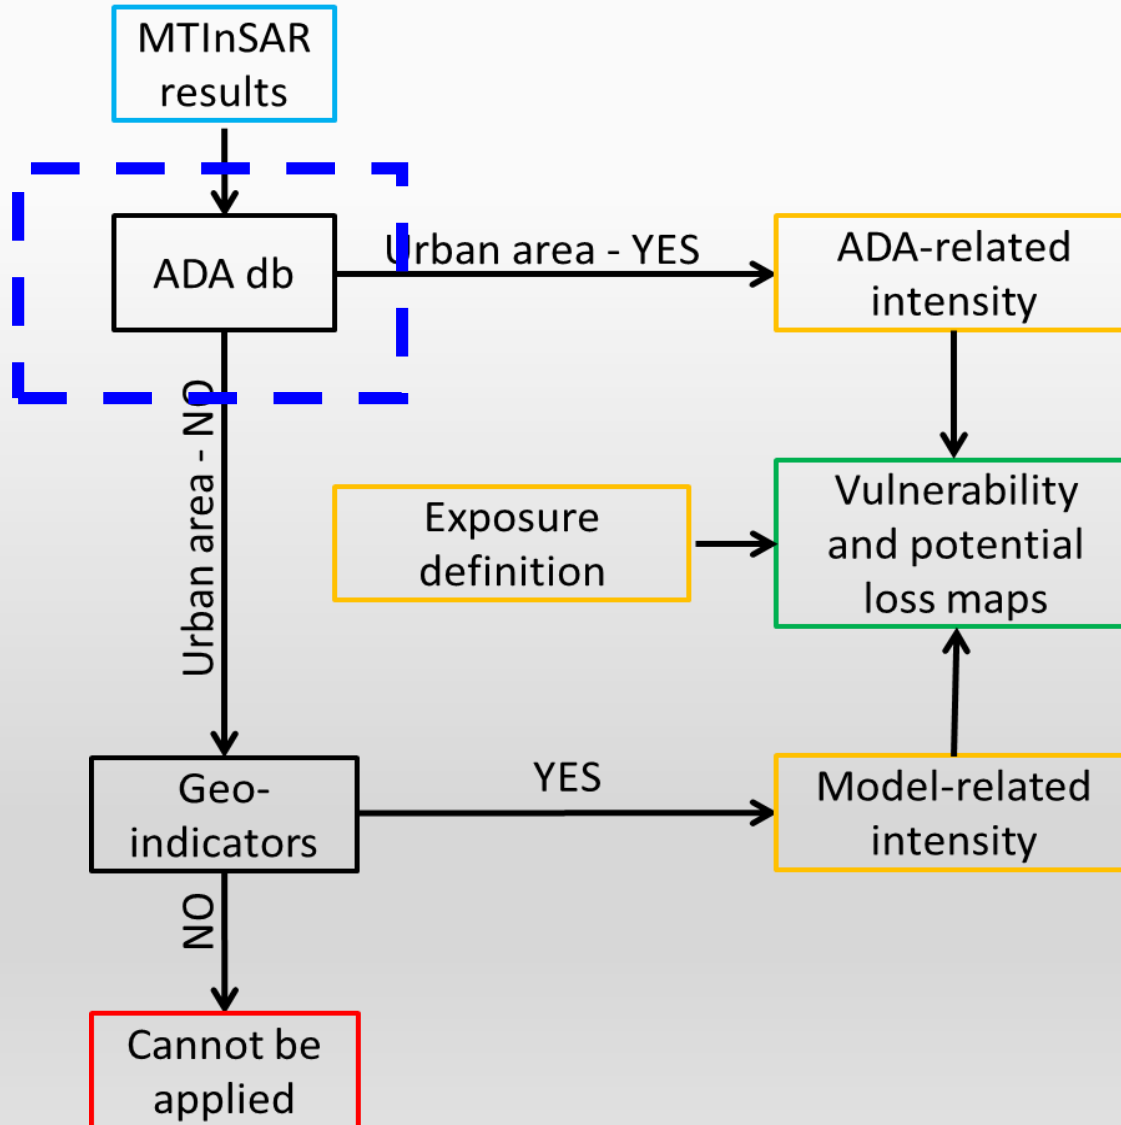

# Deformation map – Starting point

364451 PS → we need to group the fastest PS to reduce the time needed for interpretation

# Phase 1 – ADA generation

# ADA database generation

ADA finder - Find Active Deformation Areas

Input shapefile with raw deformation data  ...

Read map for the input shapefile with raw deformation data  ...

(Optional) input shapefile with AOI boundaries  ...

Output shapefile with ADA data  ...

Output shapefile with point data  ...

Isolation distance (m)

Minimum size of non-isolated clusters

Factor for stdev filter

Threshold for velocity class 1 (mm)

Clustering radius (m)

Minimum ADA size

# of values to compute the mean of the deformation

PS subset to write

Log messages

Quit Load options file Save options file Go

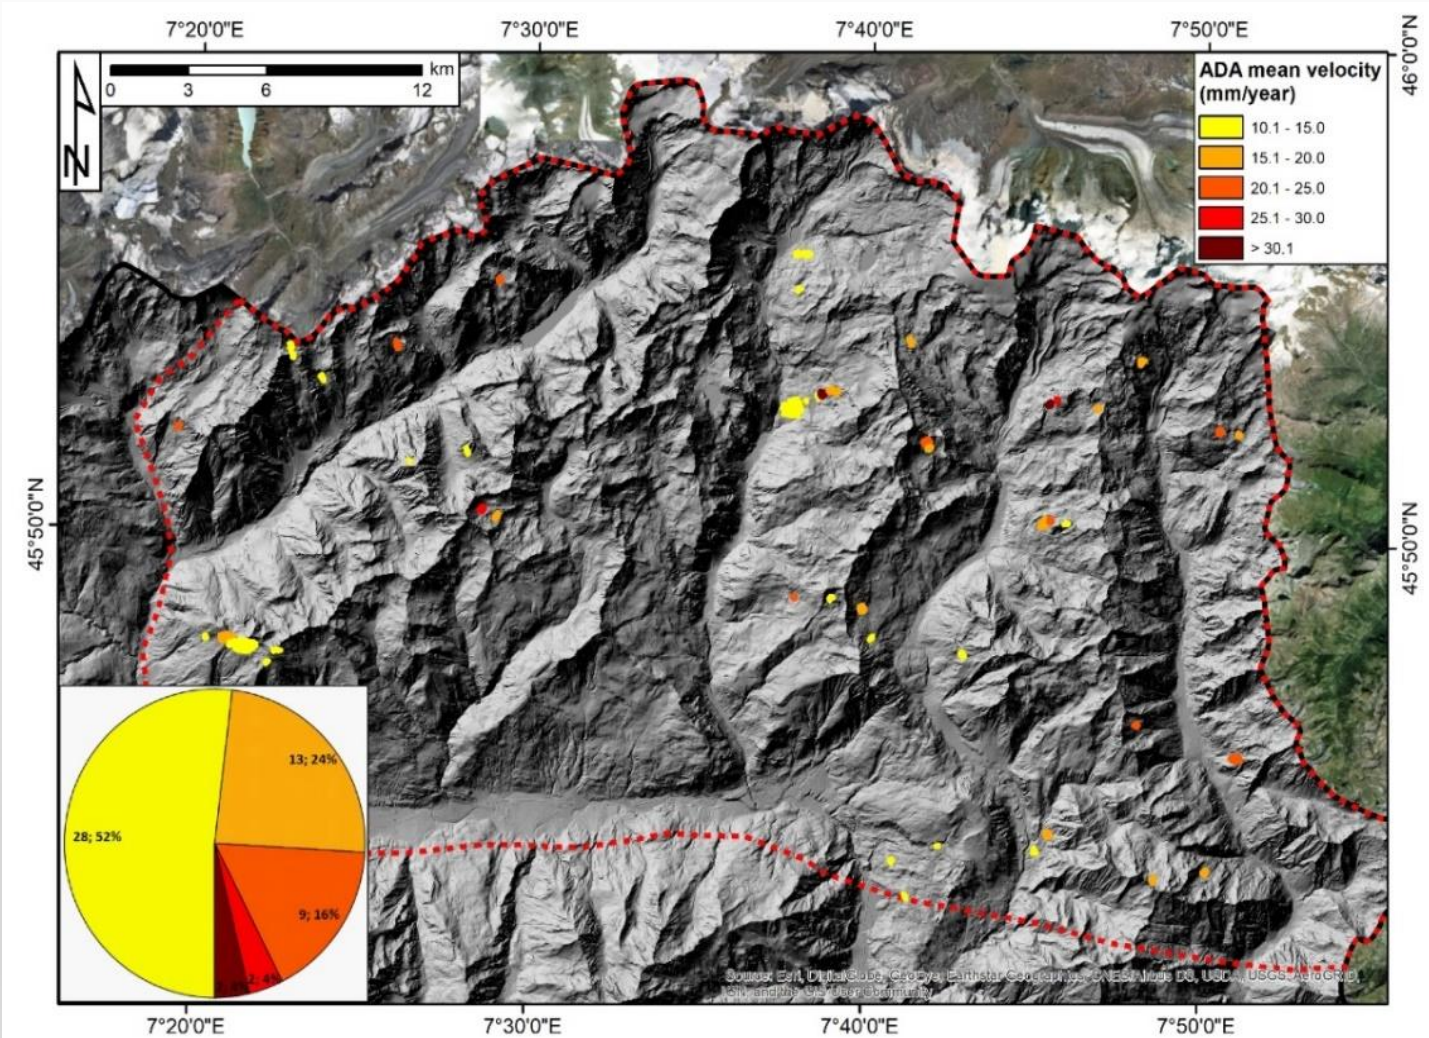

- Isolation distance=100
- Stdv dev= 2 (velocity threshold=10 mm/yr)
- Clustering radius=28
- Minimum ADA size=5

Time required to obtain the output= few seconds

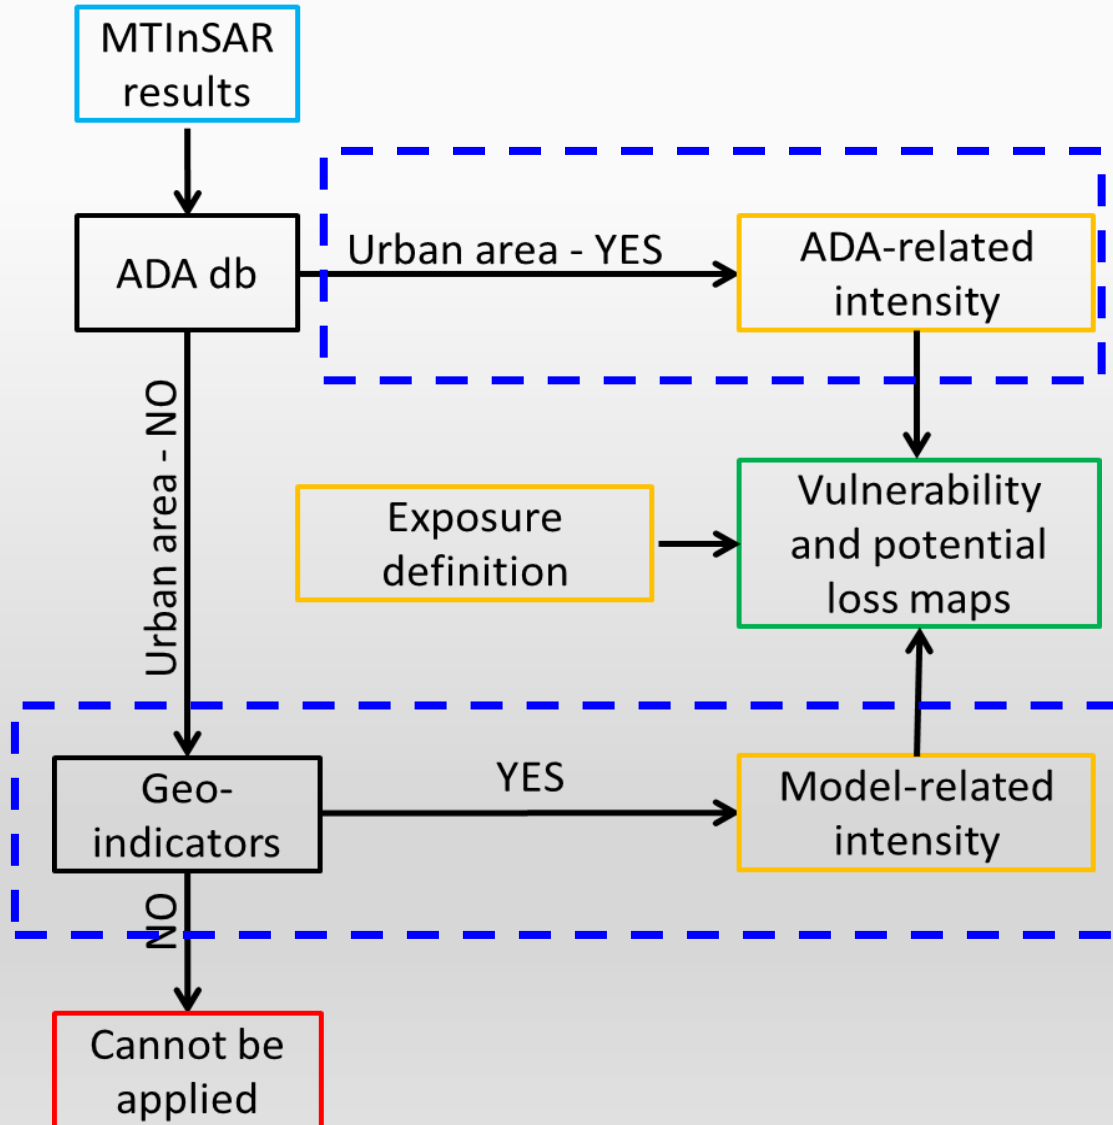

# ADA database

54 moving areas

# Phase 2 – Intensity evaluation

# Landslide intensity - concept

- Two ways to define landslide intensity starting from the ADA:
  1. **ADA-related intensity**, if an ADA directly overlaps with a urban area, a building or a road
  2. **Model-related intensity**, if an ADA does not overlap with a urban area but indicates the motion of a debris area
- Both approaches define intensity on the basis of three classes(I1,I2 and I3) depending on the variability of their outputs

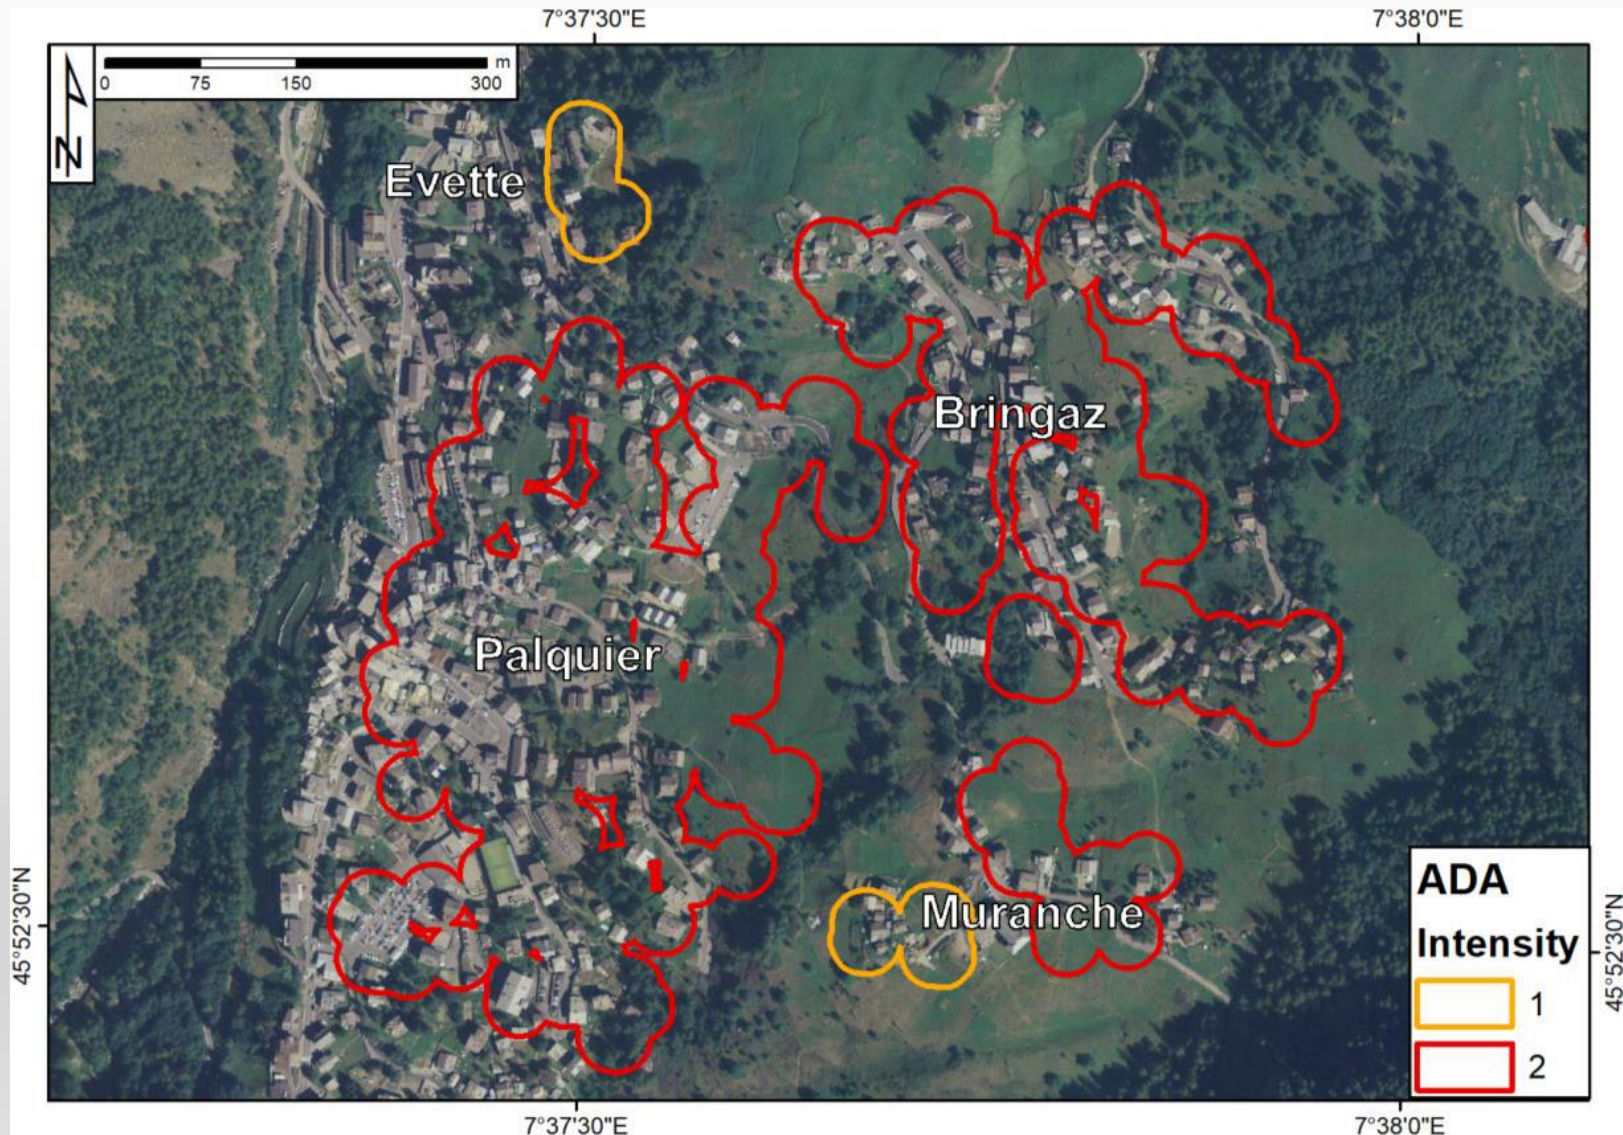

# ADA-related intensity

- Landslide intensity depends on the average velocity of each ADA directly intersecting an element at risk
- Intensity classes:
  1. **I1**: average velocity  $< 16$  mm/yr
  2. **I2**: average velocity between 16.1 and 32 mm/yr
  3. **I3**: average velocity higher than 32.1 mm/yr
- The first limit (16 mm/yr) represents the passage between extremely slow and very slow landslides, as assumed by Cruden and Varnes (1996).

# ADA-related intensity

# Model-related intensity

- Considering the low urban density of the area of interest and of Valle d'Aosta in general, we opted to use ADA in a different way
- ADA used as indicators of active mass wasting processes, involving unstable debris that could be source areas for catastrophic debris flows/debris avalanches
- A run-out model is used to evaluate the possible landslide evolution, in terms of landslide path and spatial distribution of the accumulation
- Extension of the concept of landslide intensity definition through interferometric data

# Geo-indicators

- Mapped debris flows
- Mapped debris deposits
- Presence of debris

# Run-out model

## GPP model

- Run-out & process path model for debris flow or avalanches
- Open source and implemented in SAGA GIS
- Requires a DEM as input (basic configuration)

Geosci. Model Dev., 10, 3309–3327, 2017

### The Gravitational Process Path (GPP) model (v1.0) – a GIS-based simulation framework for gravitational processes

Volker Wichmann<sup>1,2</sup>

<sup>1</sup>alpS, Centre for Climate Change Adaptation, 6020 Innsbruck, Austria

<sup>2</sup>Laserdata GmbH, 6020 Innsbruck, Austria

- Allows deriving:
  - maximum velocity of the mass
  - stopping positions
  - height of the deposited material
- Different approaches: empirical, stochastic and physically based

# GPP model

## Sink Filling

Node

# GPP model

- Process path models
  1. Maximum slope (O'Callaghan & Mark, 1984)
  2. Random walk (Gamma, 2000)
- Run-out models
  1. Geometric gradient (Heim, 1932)
  2. Fahrböschung (Heim, 1932)
  3. Shadow angle (Hunggr & Evans, 1988)
  4. One parameter friction model (Scheidegger, 1975)
  5. PCM (Perla et al., 1980)
- Deposition models (requires material height for starting cells)
  1. Sink filling (Gamma, 2000)
  2. On stop (Wichmann, 2017)
  3. Slope and on stop (Gamma 2000)

# Model inputs

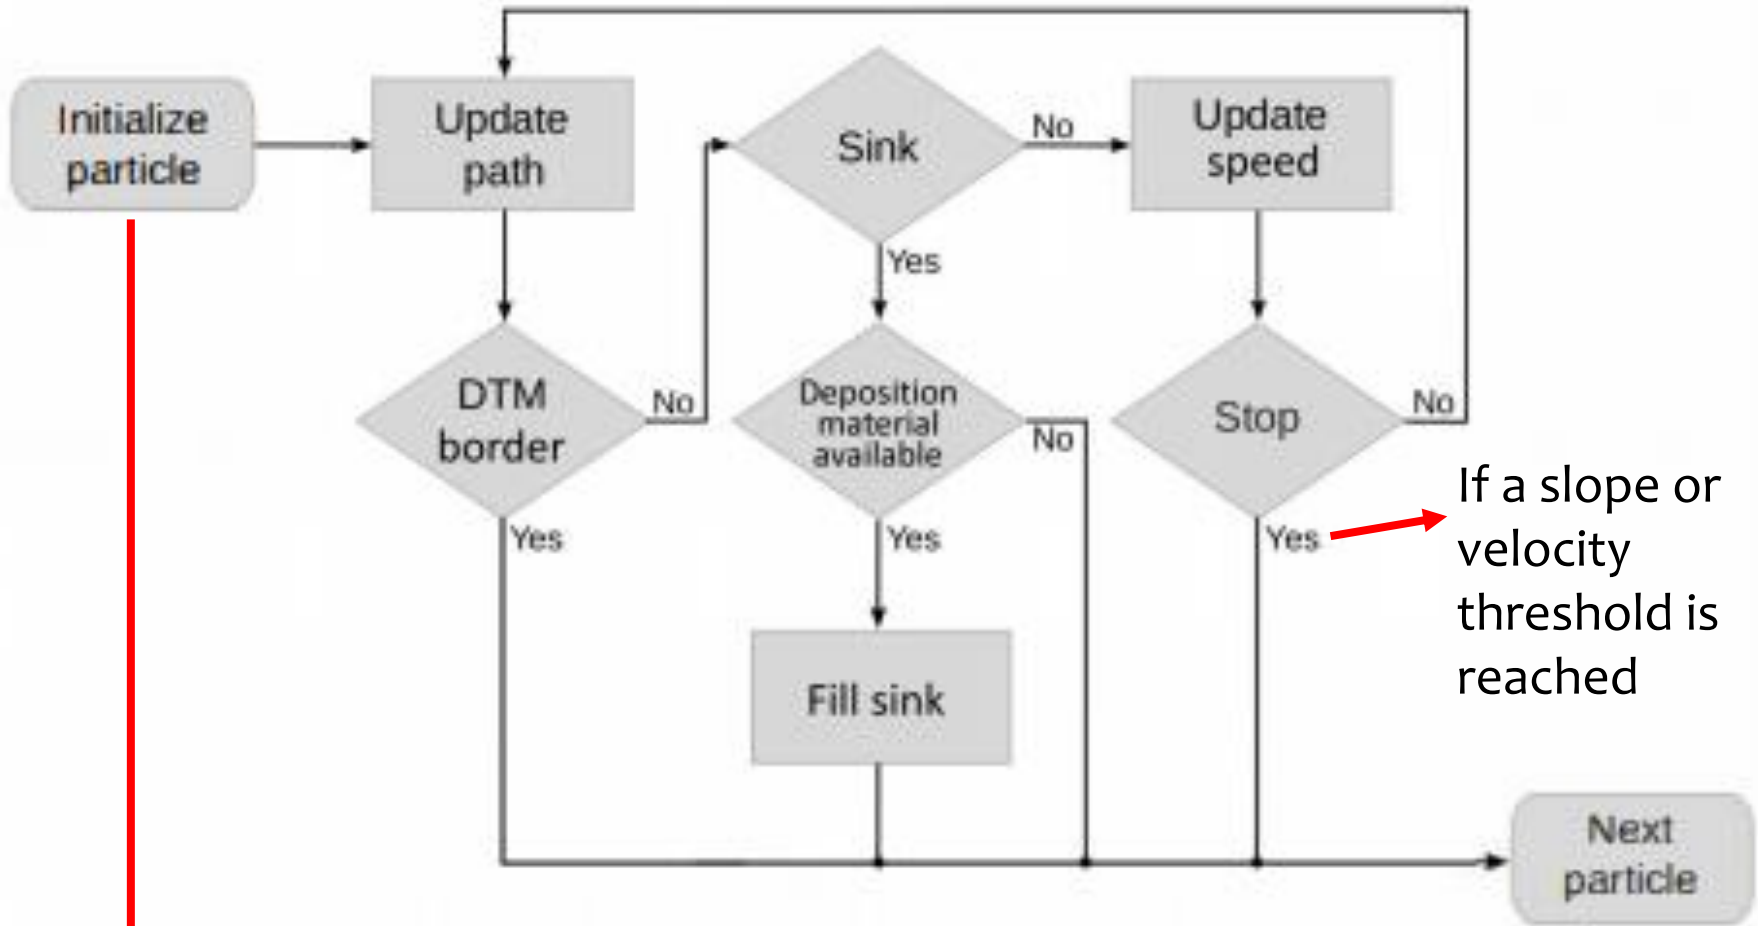

- In its simplest configuration, the GPP model **only requires a DEM and one or more source areas** (i.e. starting cells with altitude information)
- In our study, we used a more complex configuration in which:
  1. The source areas are defined on the basis of the PS point distribution of each ADA and selected considering the distribution of moving points and the local morphology
  2. The DEM resolution is 2m
  3. The height of material for each starting cell is defined and obtained by Salvatici et al. (2018) using the Geomorphologically Indexed Soil Thickness model

## **Application of a physically based model to forecast shallow landslides at a regional scale**

Teresa Salvatici<sup>1</sup>, Veronica Tofani<sup>1</sup>, Guglielmo Rossi<sup>1</sup>, Michele D'Ambrosio<sup>1</sup>, Carlo Tacconi Stefanelli<sup>1</sup>, Elena Benedetta Masi<sup>1</sup>, Ascanio Rosi<sup>1</sup>, Veronica Pazzi<sup>1</sup>, Pietro Vannocci<sup>1</sup>, Miriana Petrolo<sup>1</sup>, Filippo Catani<sup>1</sup>, Sara Ratto<sup>2</sup>, Hervé Stevenin<sup>2</sup>, and Nicola Casagli<sup>1</sup>

# Work flow of the process

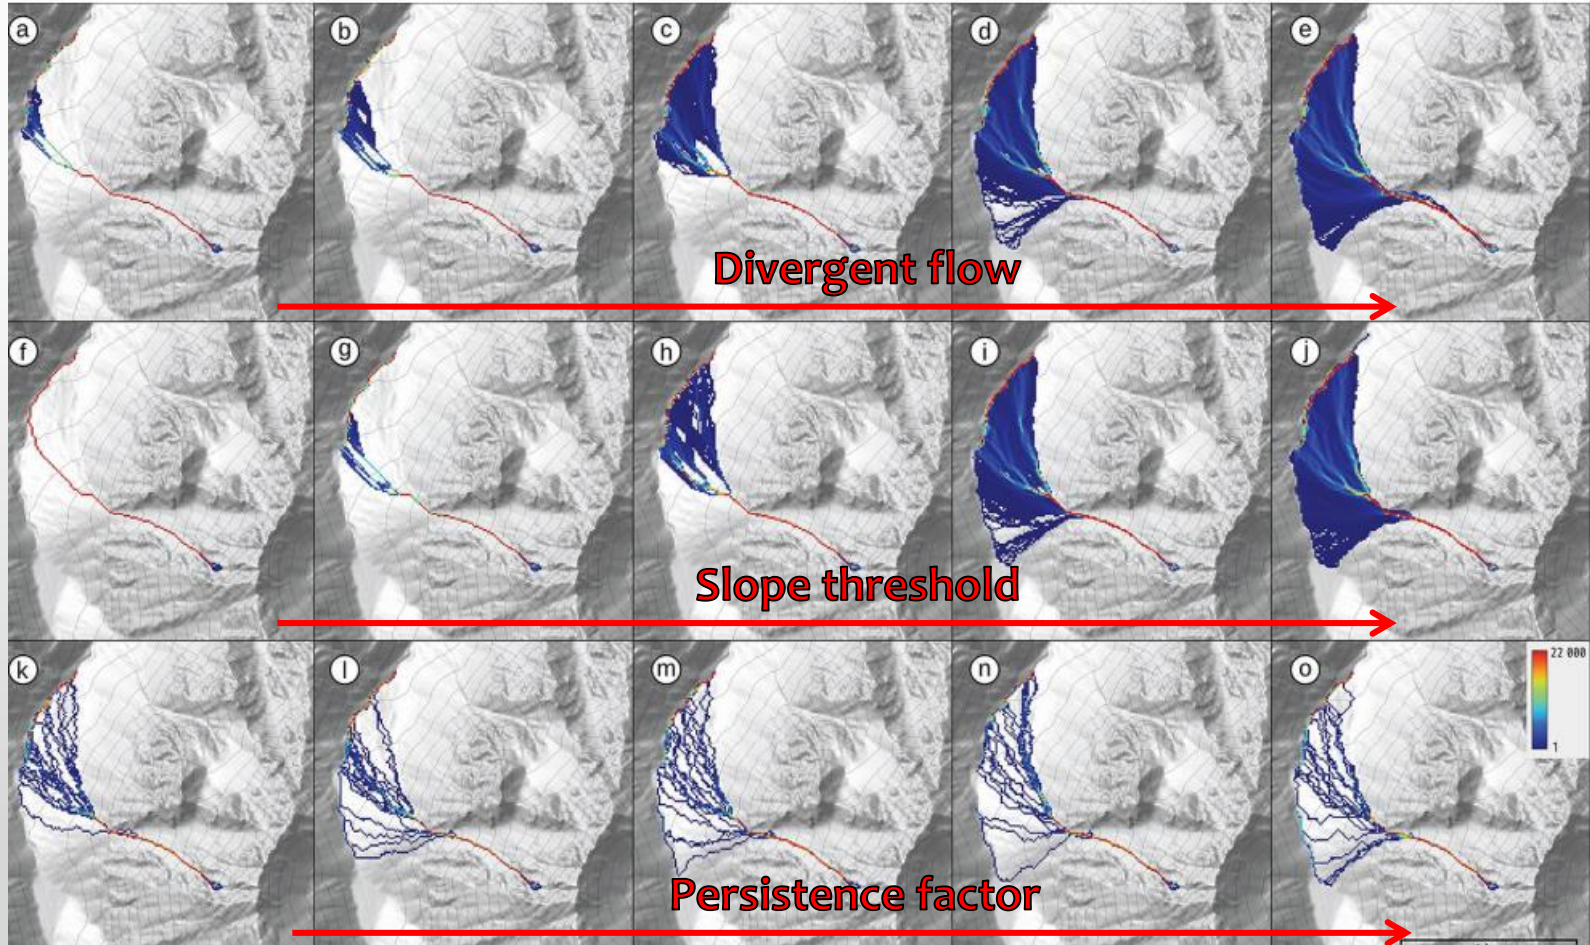

If a slope or velocity threshold is reached

Each starting cell is characterized by an elevation and (if available) a material thickness

# Random walk model

- Defines how each particle “move” and how the flow will be
- 3 inputs parameters are needed. They are set at basin/flank scale

# PCM model

- Two-parameter friction model
- It is a center-of-mass model in which two parameters that govern the motion of the particle must be defined: the **sliding friction coefficient** ( $\mu$ ) and the **mass-to-drag ratio**
- $\mu = 0.19 * a^{-0.24}$  where  $a$  is the catchment area
- The mass-to-drag ratio depends on the size distribution of the material and for debris flows made of granular materials and blocks is on average equal to 70

$$v_i = \sqrt{\alpha_i \cdot (M/D)_i \cdot (1 - e^{\beta_i}) + (v_{(i-1)})^2 \cdot e^{\beta_i}}$$

and

$$\alpha_i = g (\sin \theta_i - \mu_i \cos \theta_i),$$

→ local slope

$$\beta_i = \frac{-2L_i}{(M/D)_i},$$

→ slope length between adjacent grid cells

The process stops as soon as the square root becomes undefined

# Slope & On stop

Model	Slope & On Stop
Initial Deposition on Stop	20
Slope Threshold	20
Maximum Deposition along Path	20
Minimum Path Length	100

- The deposition starts once the slope drops below a specific threshold
- The amount of material deposited on the stopping cell (%) is controlled by the Initial Deposition on Stop parameter
- At a slope of zero, the Maximum Deposition along Path parameter controls the percentage of material that is deposited
- The Minimum Path Length, which describes the distance along the process path that must be exceeded before deposition sets in

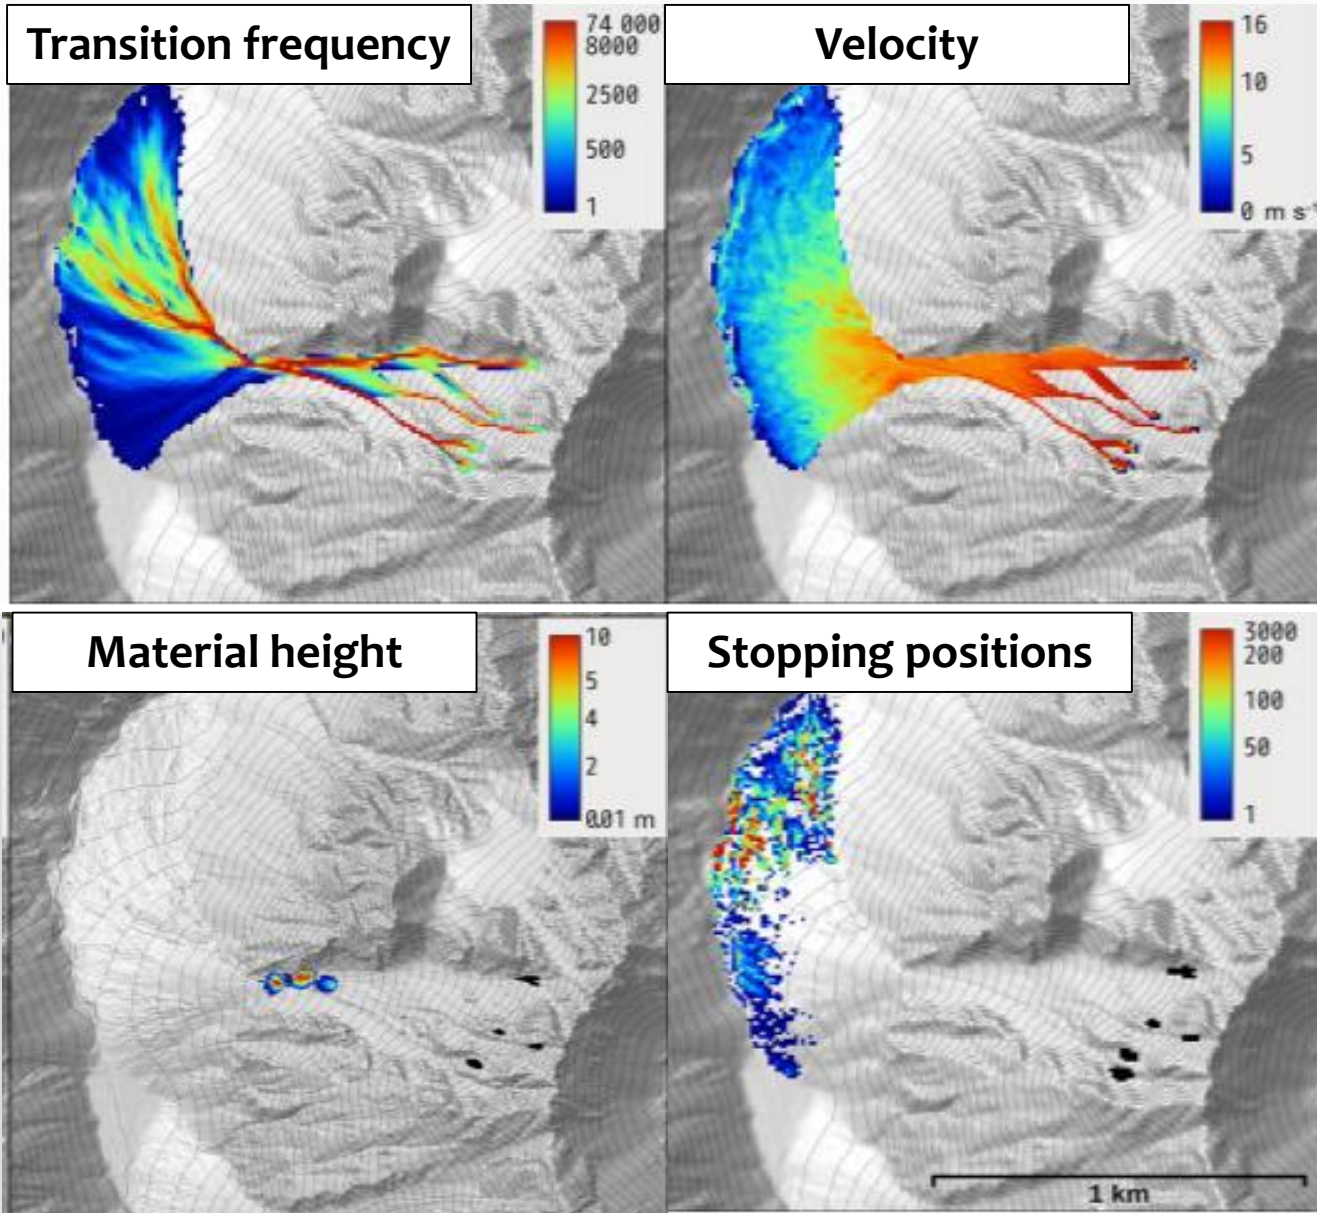

# In summary

What we have to do:

1. Select all the ADA that respect the “Geo-indicators” condition
2. Group them for macro-areas (same flank, basin, etc...)
3. Run the model on a known debris flow in the area of interest to calibrate the model.
4. Use the parameters to run the GPP using as source areas the ADA; multiple source areas can be defined within the same ADA, depending on the PS distribution and on the local morphology
5. If pt.3 is not achievable, select one ADA and launch multiple GPP runs until you obtain a reasonable result

# Outputs of the model

# Intensity definition

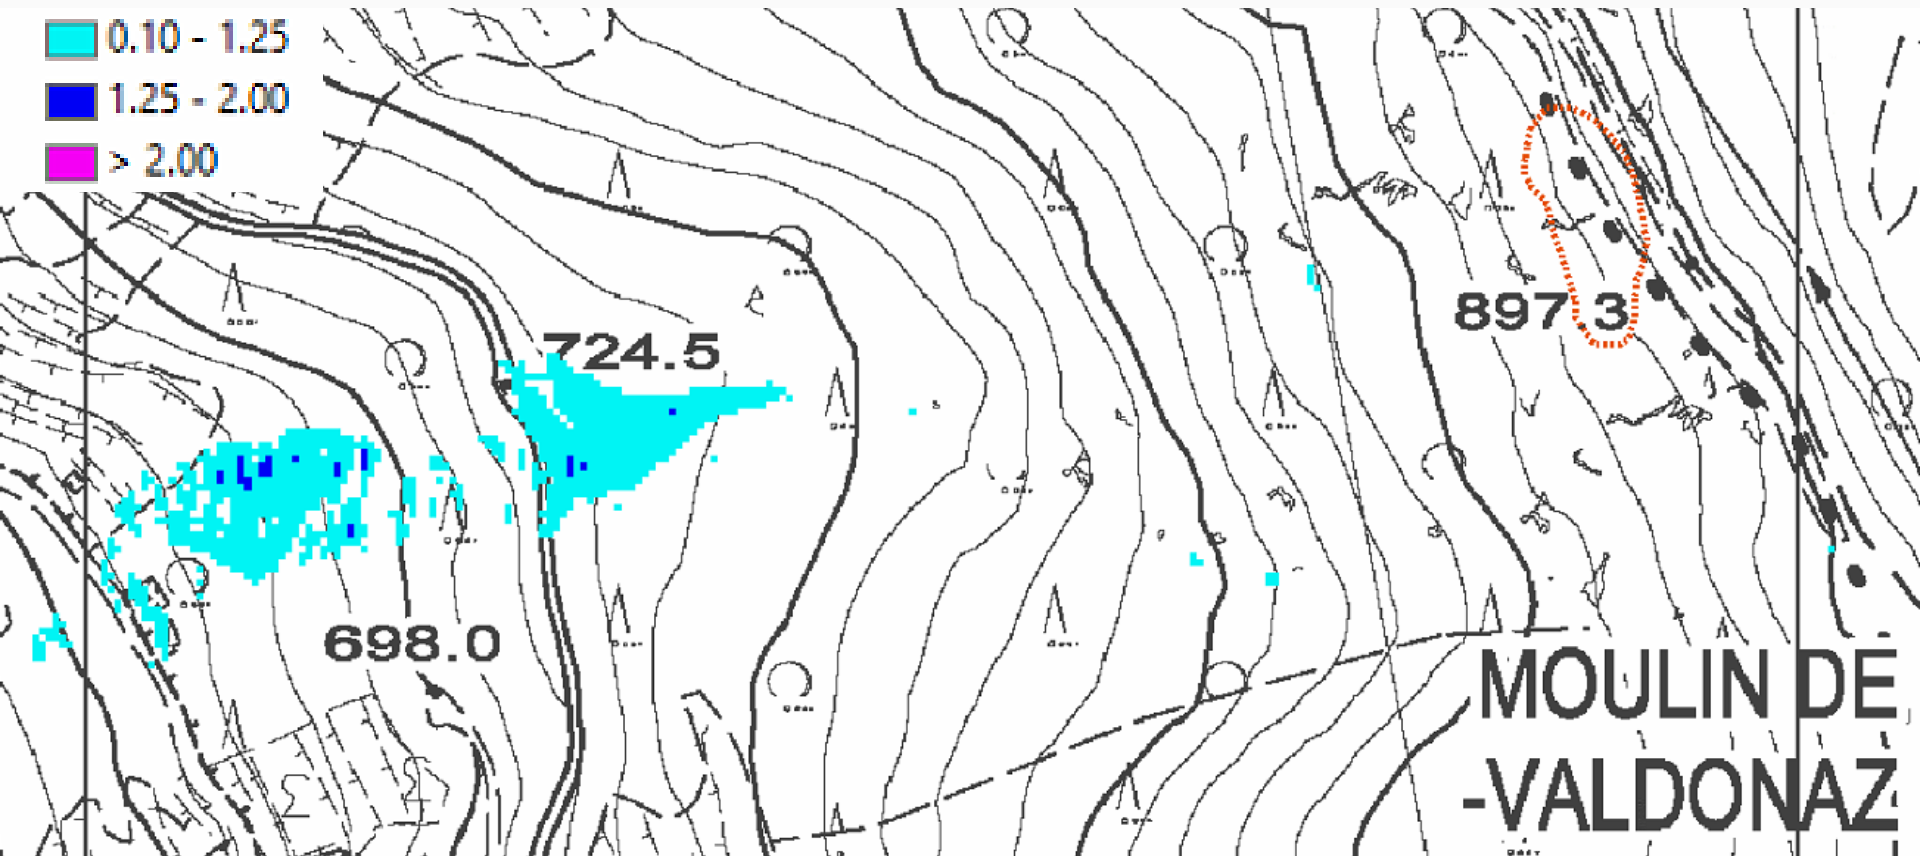

- The height of material at every cell as a proxy for landslide intensity
- Three classes of intensity:
  1. I1: height of the material lower than 1.25 m
  2. I2: height of the material between 1.26 and 2 m
  3. I3: height of the material higher than 2.01 m

The values chosen are defined following the vulnerability functions derived by Papathoma-Kohle et al. (2015) using real debris flow events in South Tyrol (Austria)

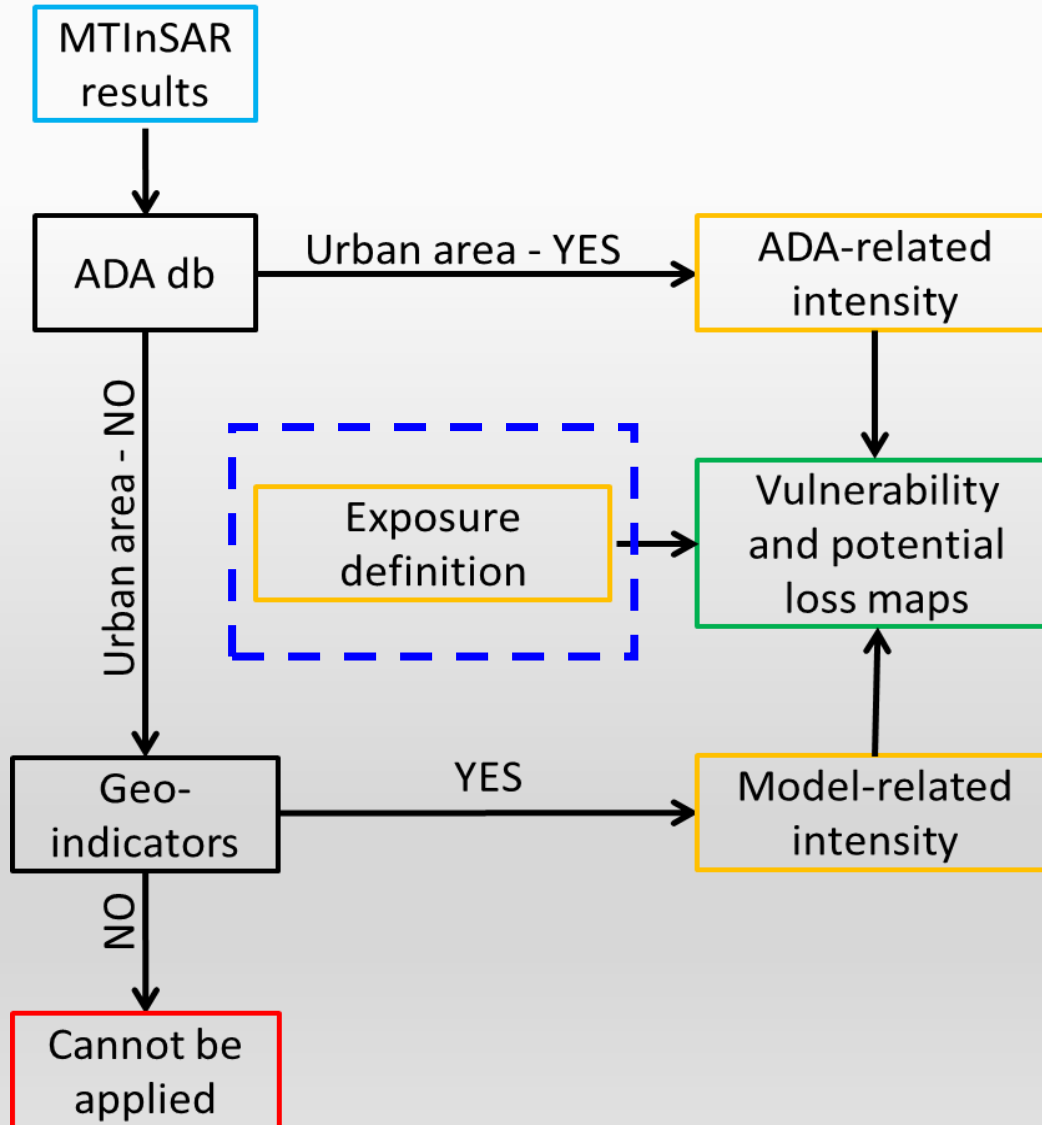

# Model-related intensity

# Phase 3 – Exposure definition

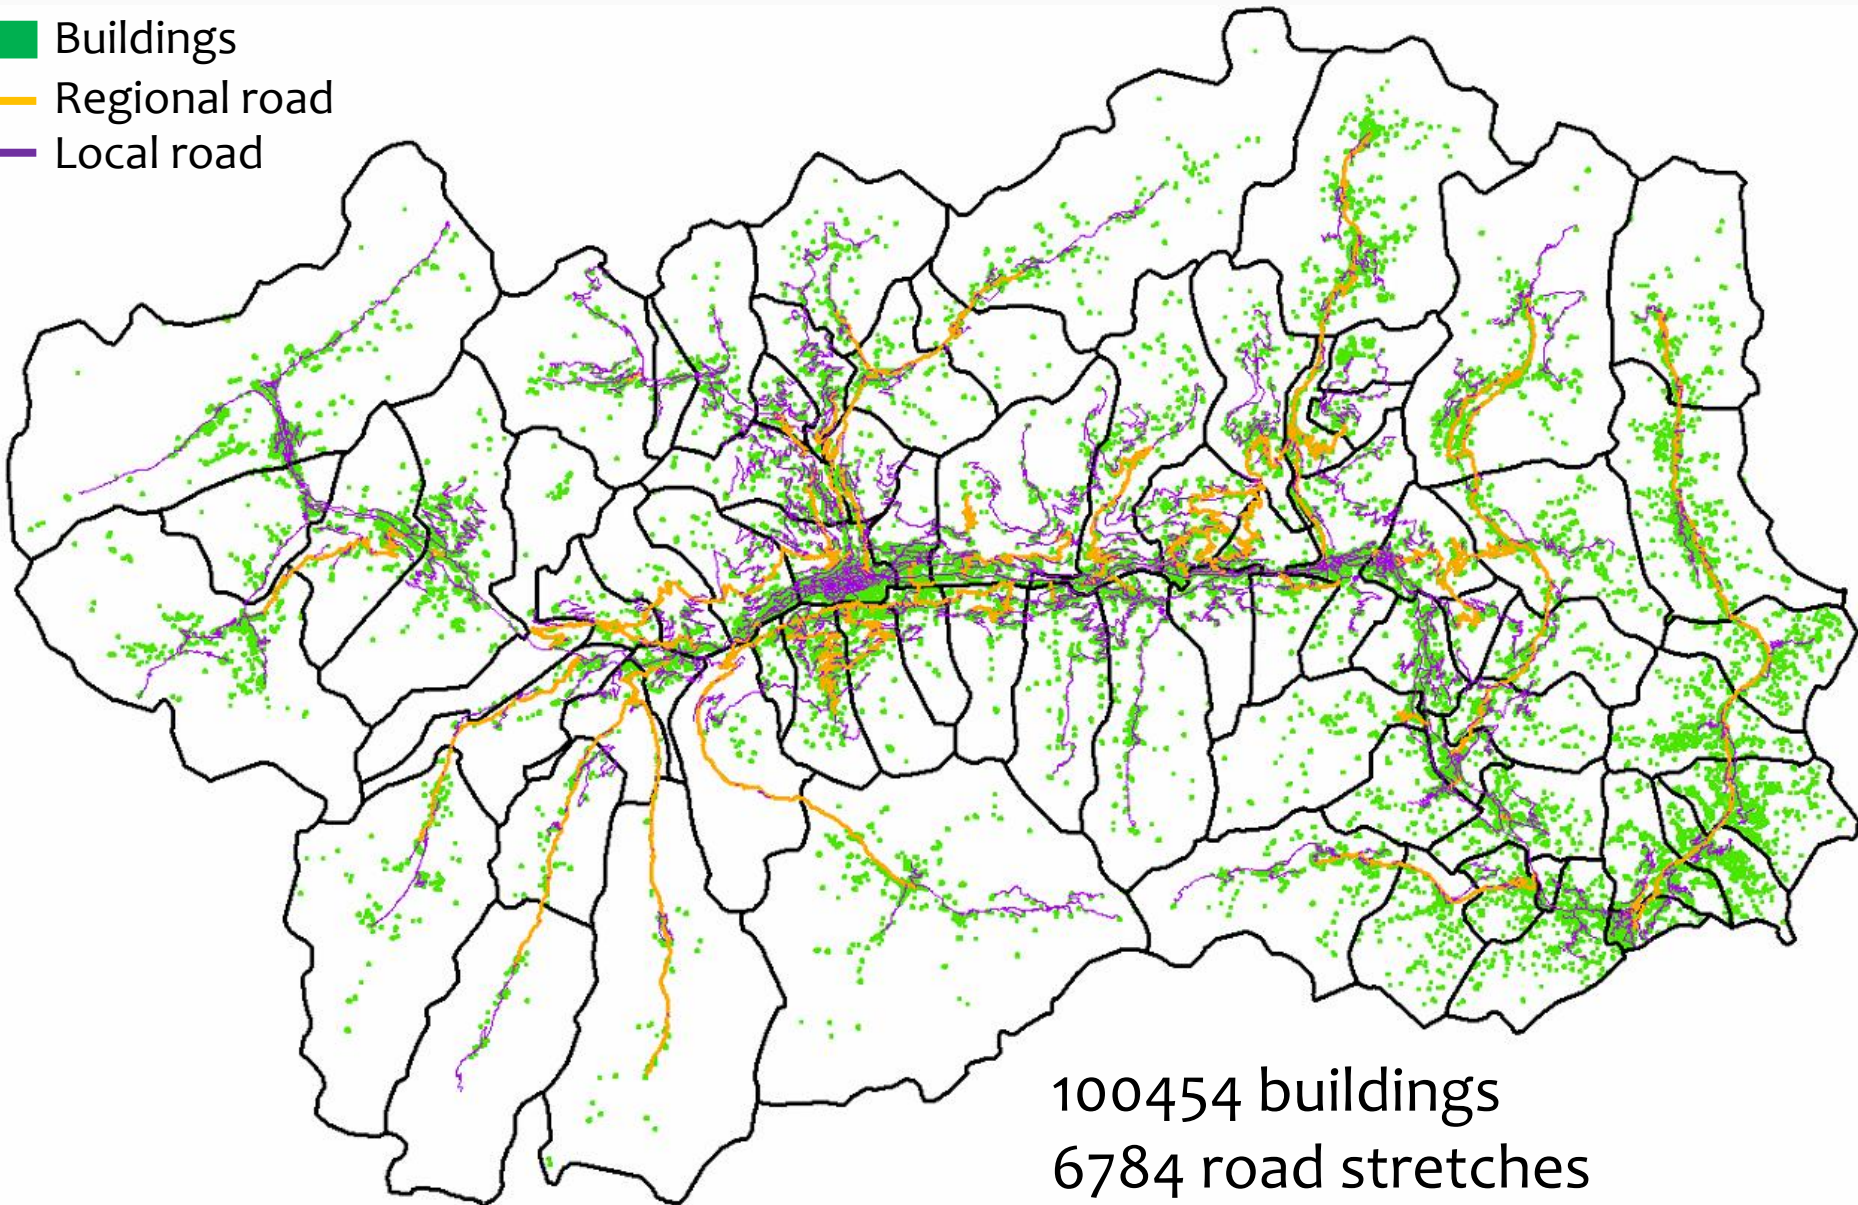

# Elements at risk database

Buildings

Regional road

Local road

100454 buildings  
6784 road stretches

# Exposure

- We defined exposure as an economic value of properties, not considering people occupancy
- We assigned the market values of a building at municipality scale. If not possible, we used the construction/renewal cost multiplied by 10
- For roads we used the construction cost of the road itself, not considering accessory costs
- Exposure of cultural heritages – including churches – is not defined (it is too much site-related)

# Exposure values

Construction cost for different types of roads. Source: ANAS

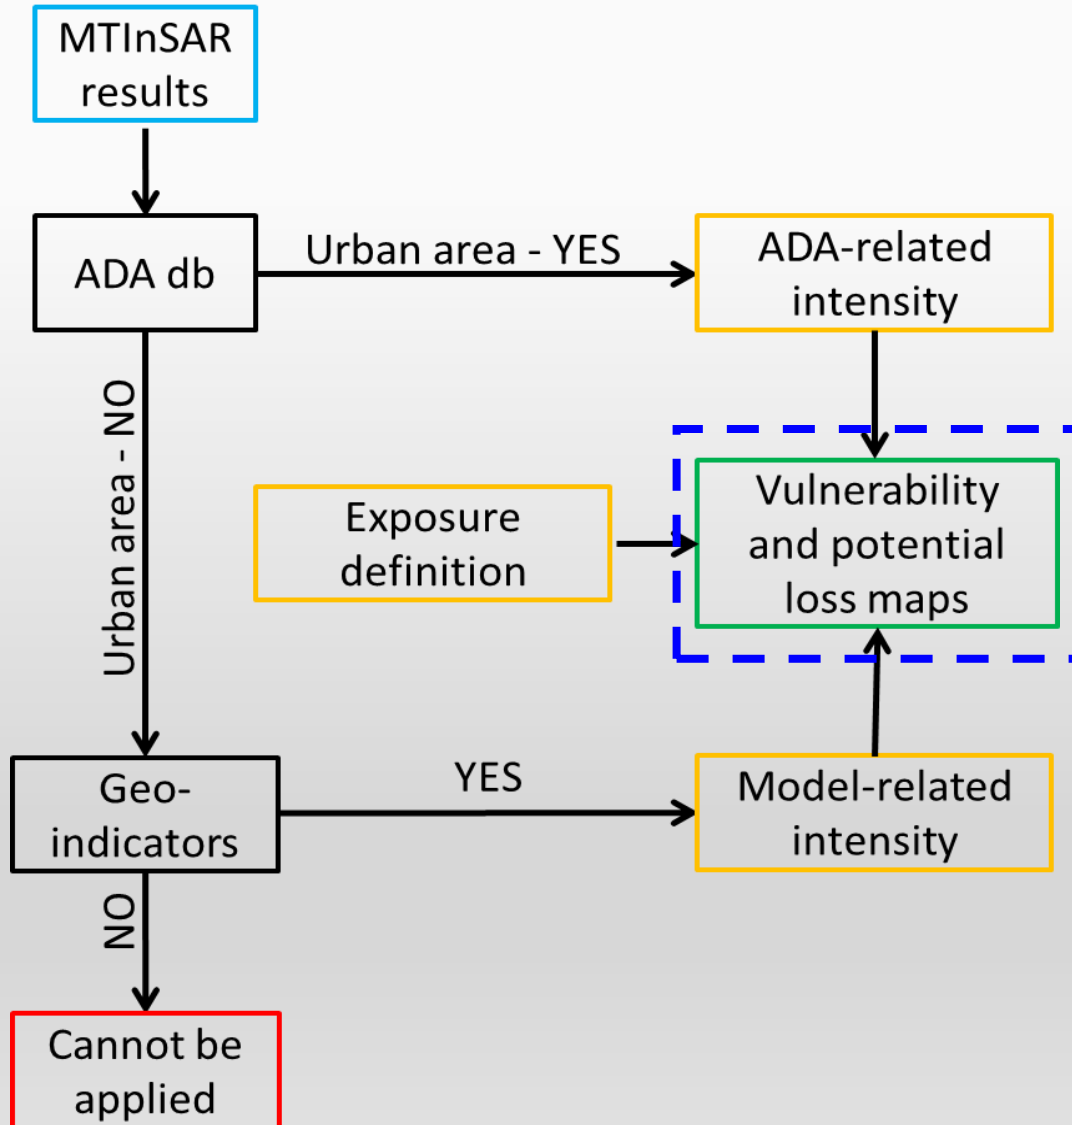

# Exposure values

Type of building/road	E (€/sqm)
Barn	80
Camping	2600
Greenhouse	50
Hotel	1550 – 4600
Industrial laboratory	740 – 1000
Local road	50
Motorway	350
Municipal road	150
Office/service sector	1175 – 2600
Private house	1075 – 4350
Provincial road	180
School complex	4000
Shed	540-890
Commercial building (shop, restaurant, etc...)	865 – 2100
Shopping mall	1400 – 2200
Sport facilities	15-120
Stable	120
Regional/State road	250
Warehouse	680 - 1000

- If the value is a range the OMI database is used. The value is assigned depending on the municipality where the element at risk is found
- The value for private houses has a large variation because of the more or less touristic “level” of the municipality

# Phase 4 – Vulnerability & potential loss

# Vulnerability

- Vulnerability varies, as a function of landslide intensity, between 0 (no damage) and 1 (complete loss).
- Each value of vulnerability is defined by the typology of element at risk following a data driven approach
- Linear elements have the highest vulnerability values for each intensity class.
- If intensity is equal to zero, then vulnerability is null.

# Vulnerability values

Type of building/road	V (I=1)	V (I=2)	V (I=3)
Barn	0.2	0.4	0.6
Camping	0.4	0.6	0.8
Greenhouse	0.2	0.4	0.6
Hotel	0.15	0.3	0.5
Industrial laboratory	0.1	0.2	0.5
Local road	0.6	0.8	1
Motorway	0.4	0.6	0.8
Municipal road	0.6	0.8	1
Office/service sector	0.1	0.3	0.6
Private house	0.2	0.35	0.6
Provincial road	0.6	0.8	1
School complex	0.3	0.5	0.7
Shed	0.2	0.4	0.6
Commercial building (shop, restaurant, etc...)	0.2	0.35	0.6
Shopping mall	0.2	0.35	0.6
Sport facilities	0.3	0.5	0.7
Stable	0.15	0.4	0.6
Regional/State road	0.4	0.6	0.8
Warehouse	0.2	0.4	0.6

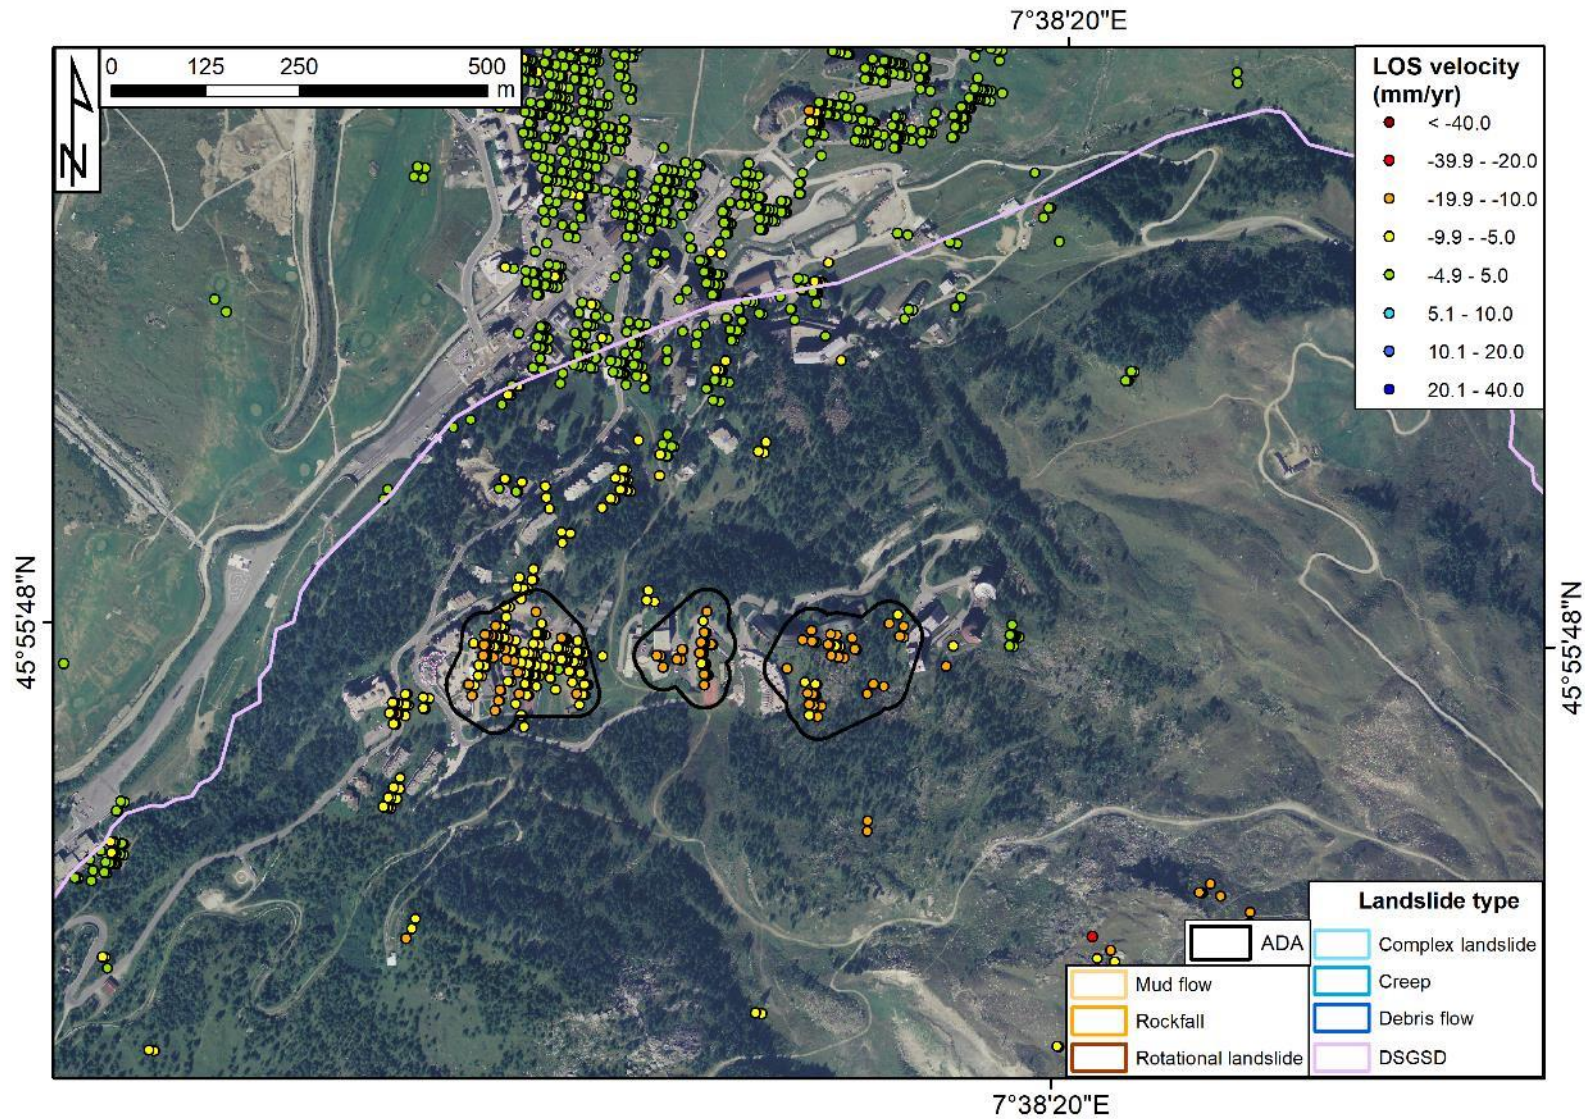

# Potential loss

- $D = I(fV) \times E$
- The potential loss is referred to the direct impact of a landslide on a building or road and it is expressed in quantitative terms (Euros for square meters)
- If one or both vulnerability and exposure are null, the potential loss is zero

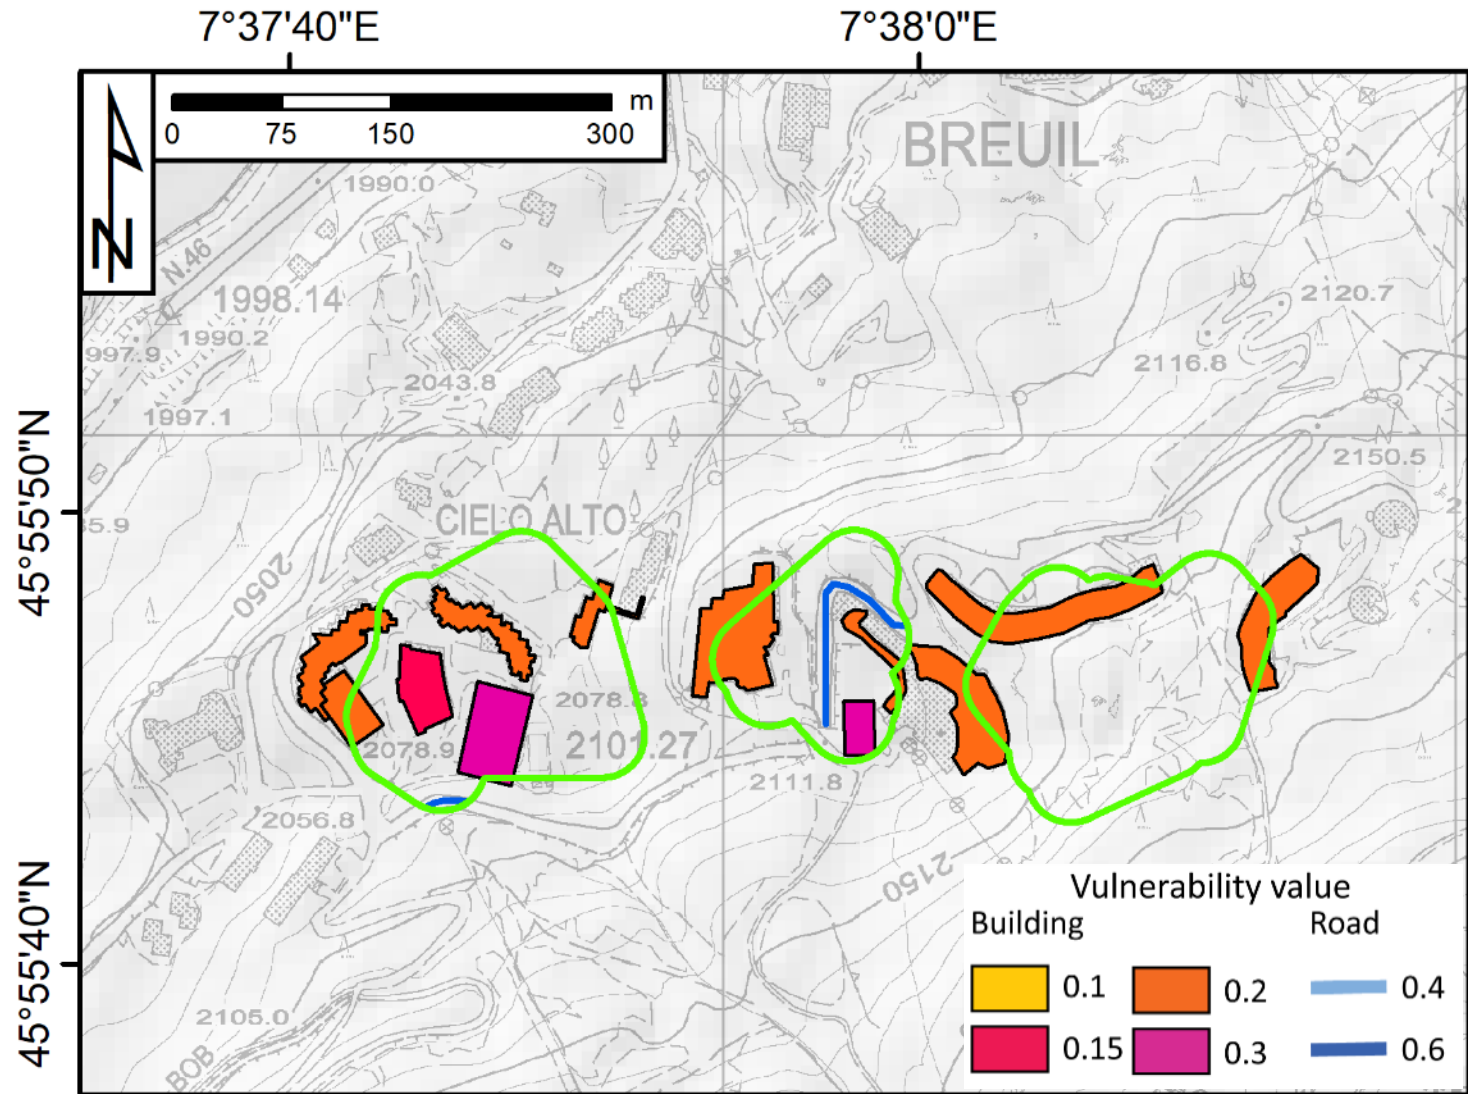

# ADA-related intensity (1)

Cervinia, Valtournenche municipality. 3 ADA in the toe area of a large DSGSD

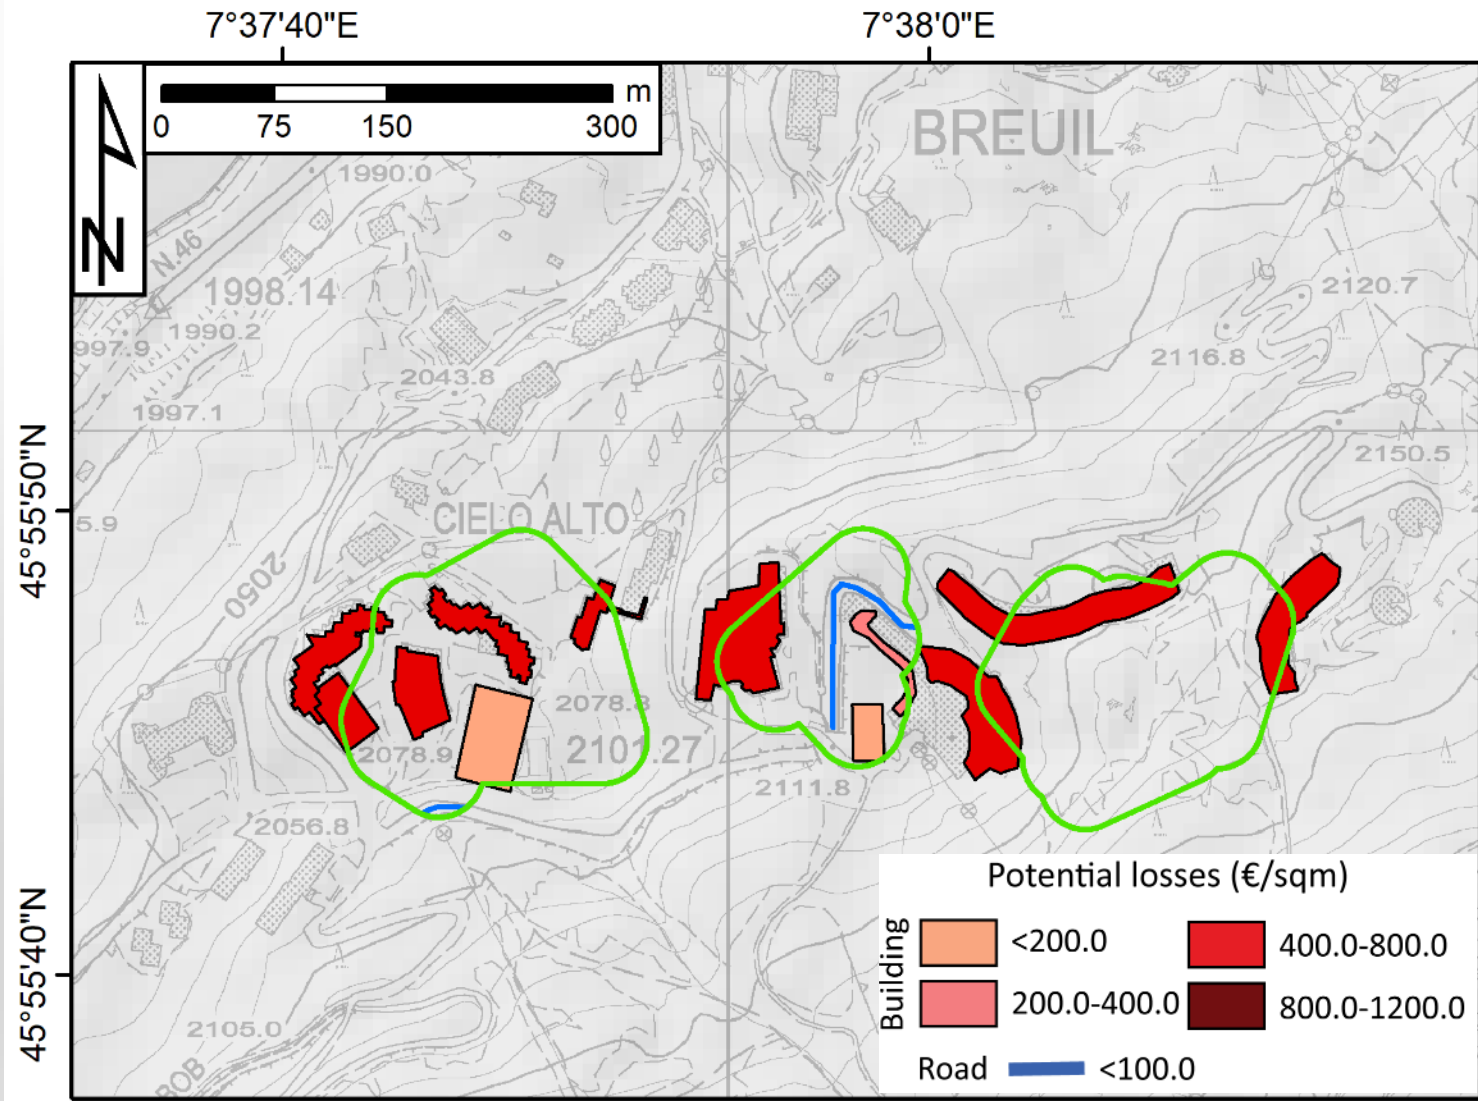

# ADA-related intensity (1)

Residential buildings, a shopping mall, 2 tennis courts, an hotel and a restaurant. 1 local road

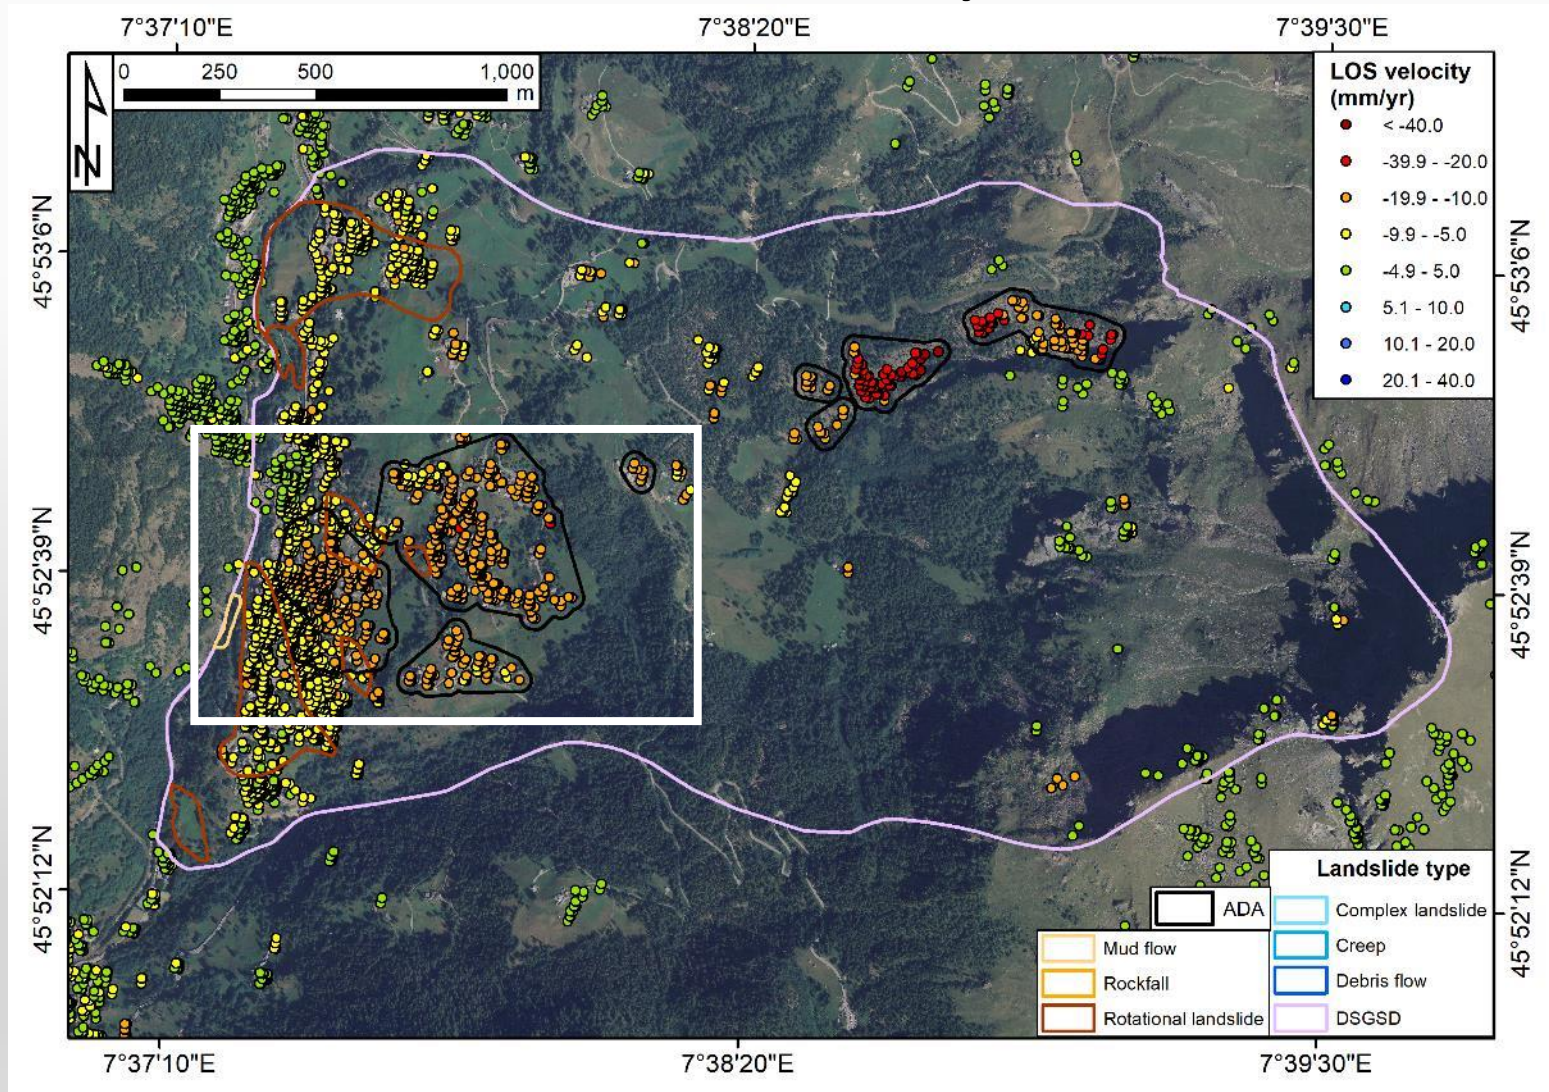

# ADA-related intensity (1)

The highest potential loss is 525 €/sqm for a 4-stars hotel

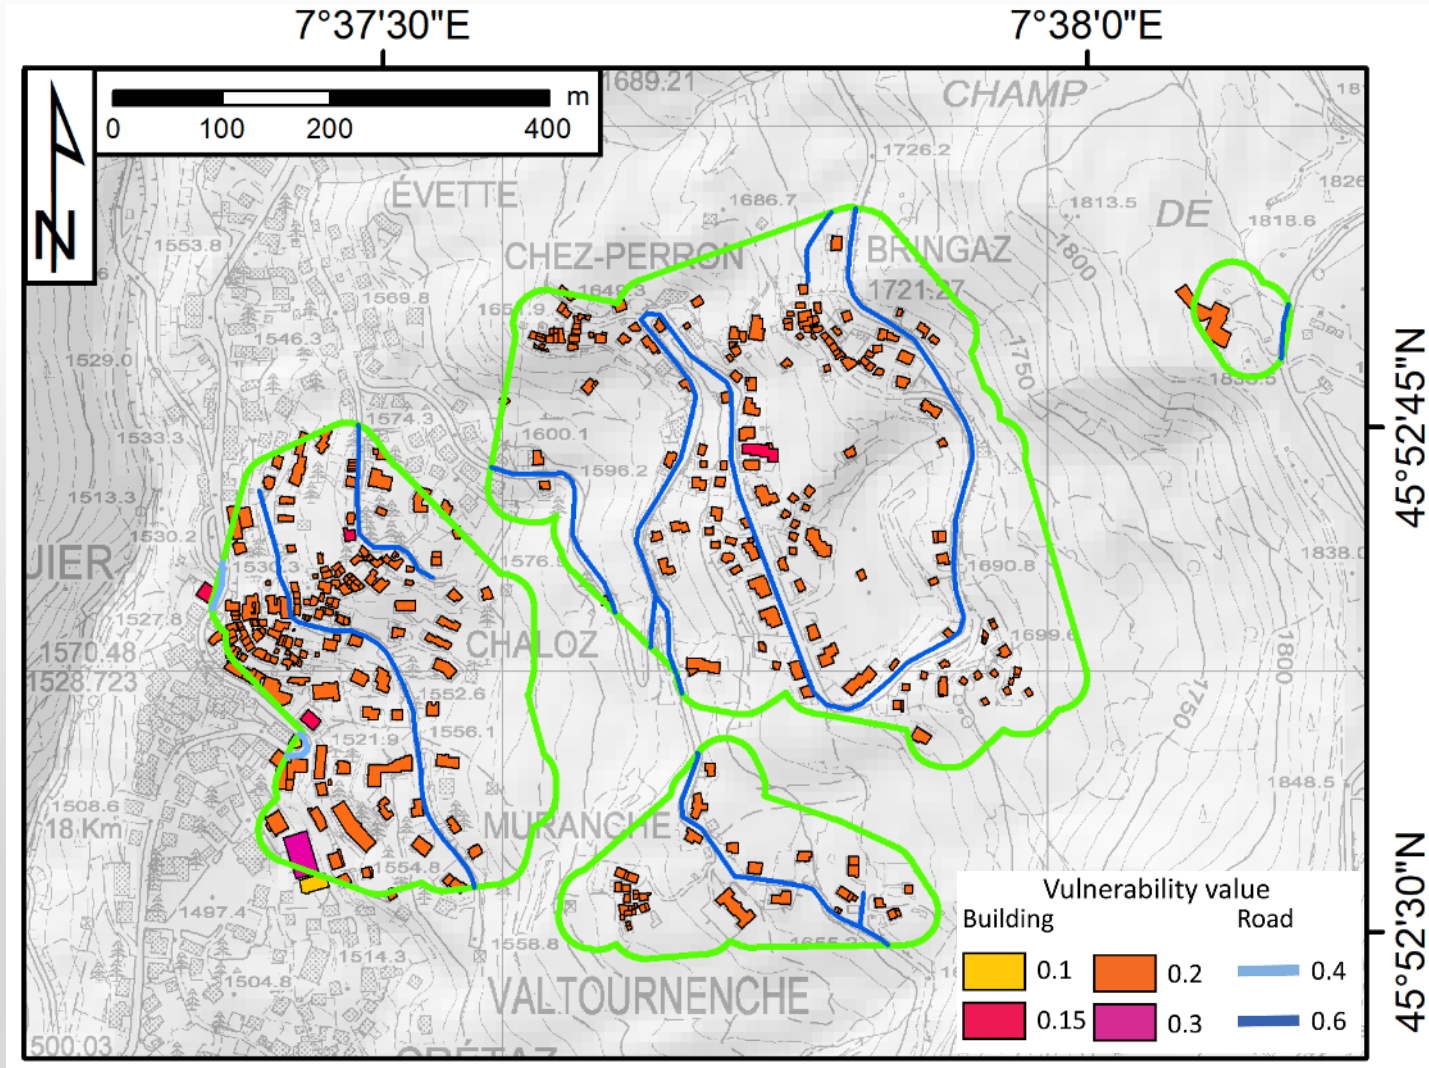

# ADA-related intensity (2)

Chaloz village, Valtournenche municipality. Multiple ADA within a large DSGSD and various rotational landslides

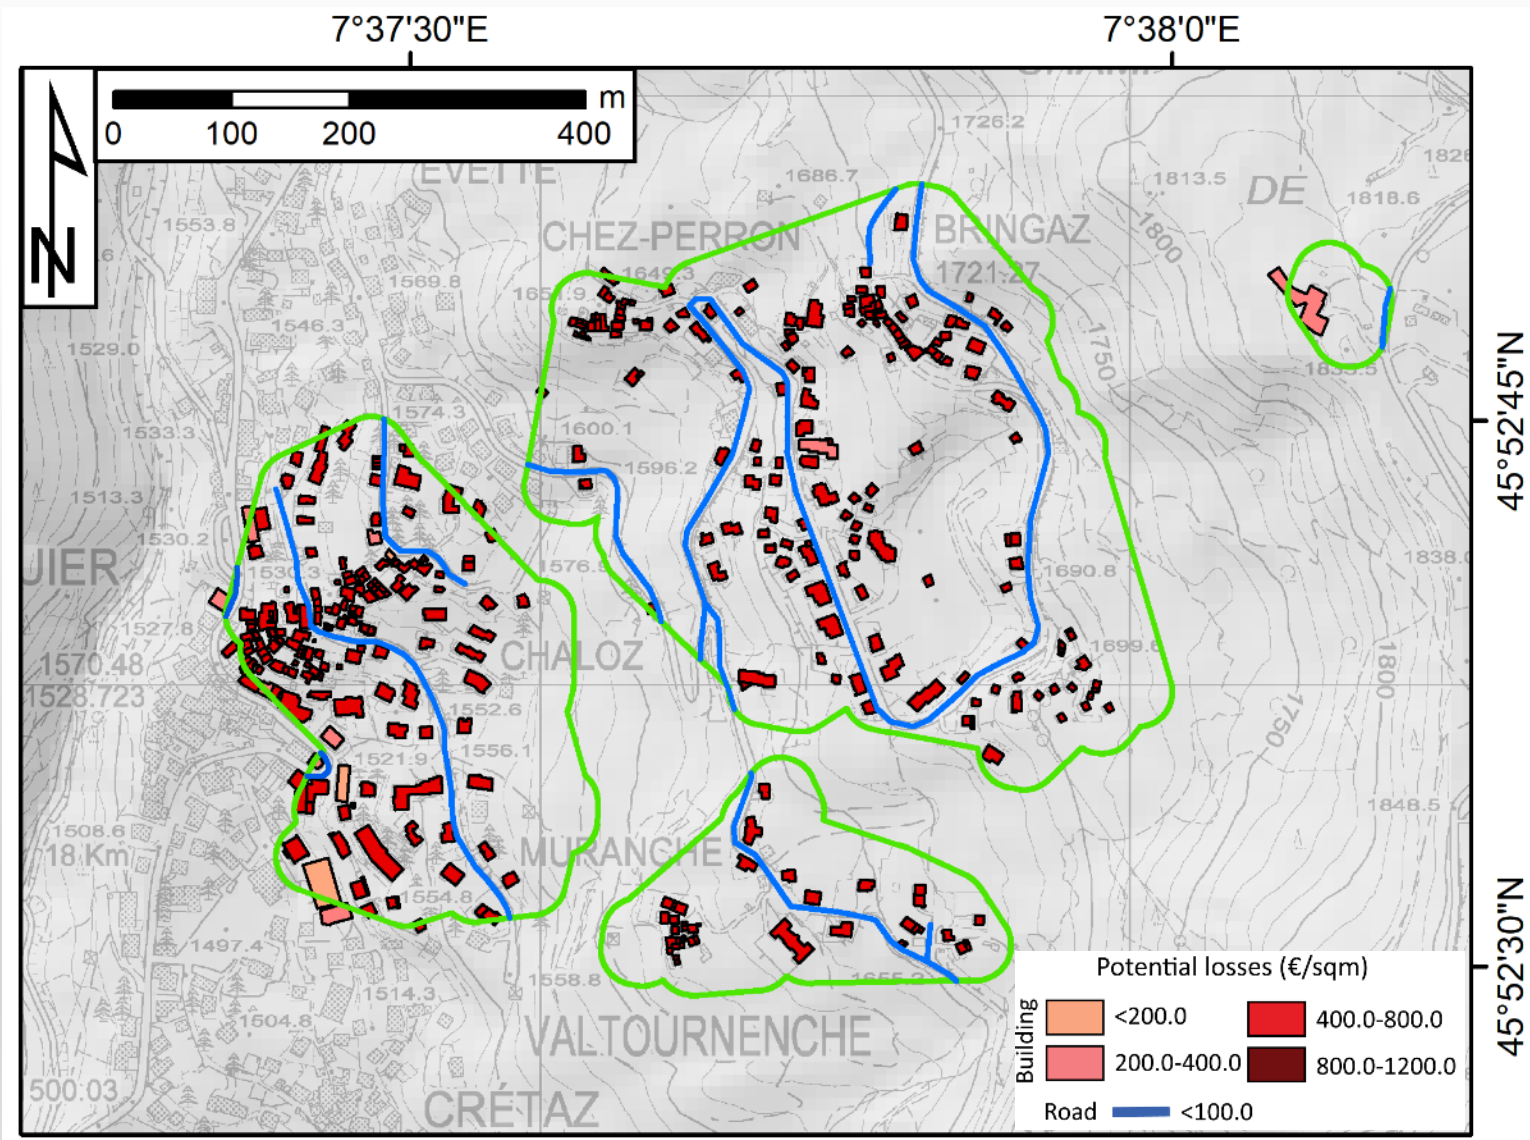

# ADA-related intensity (2)

90% private houses, some shops, warehouses, four hotels, barns and a tennis court. Some local roads and a regional road

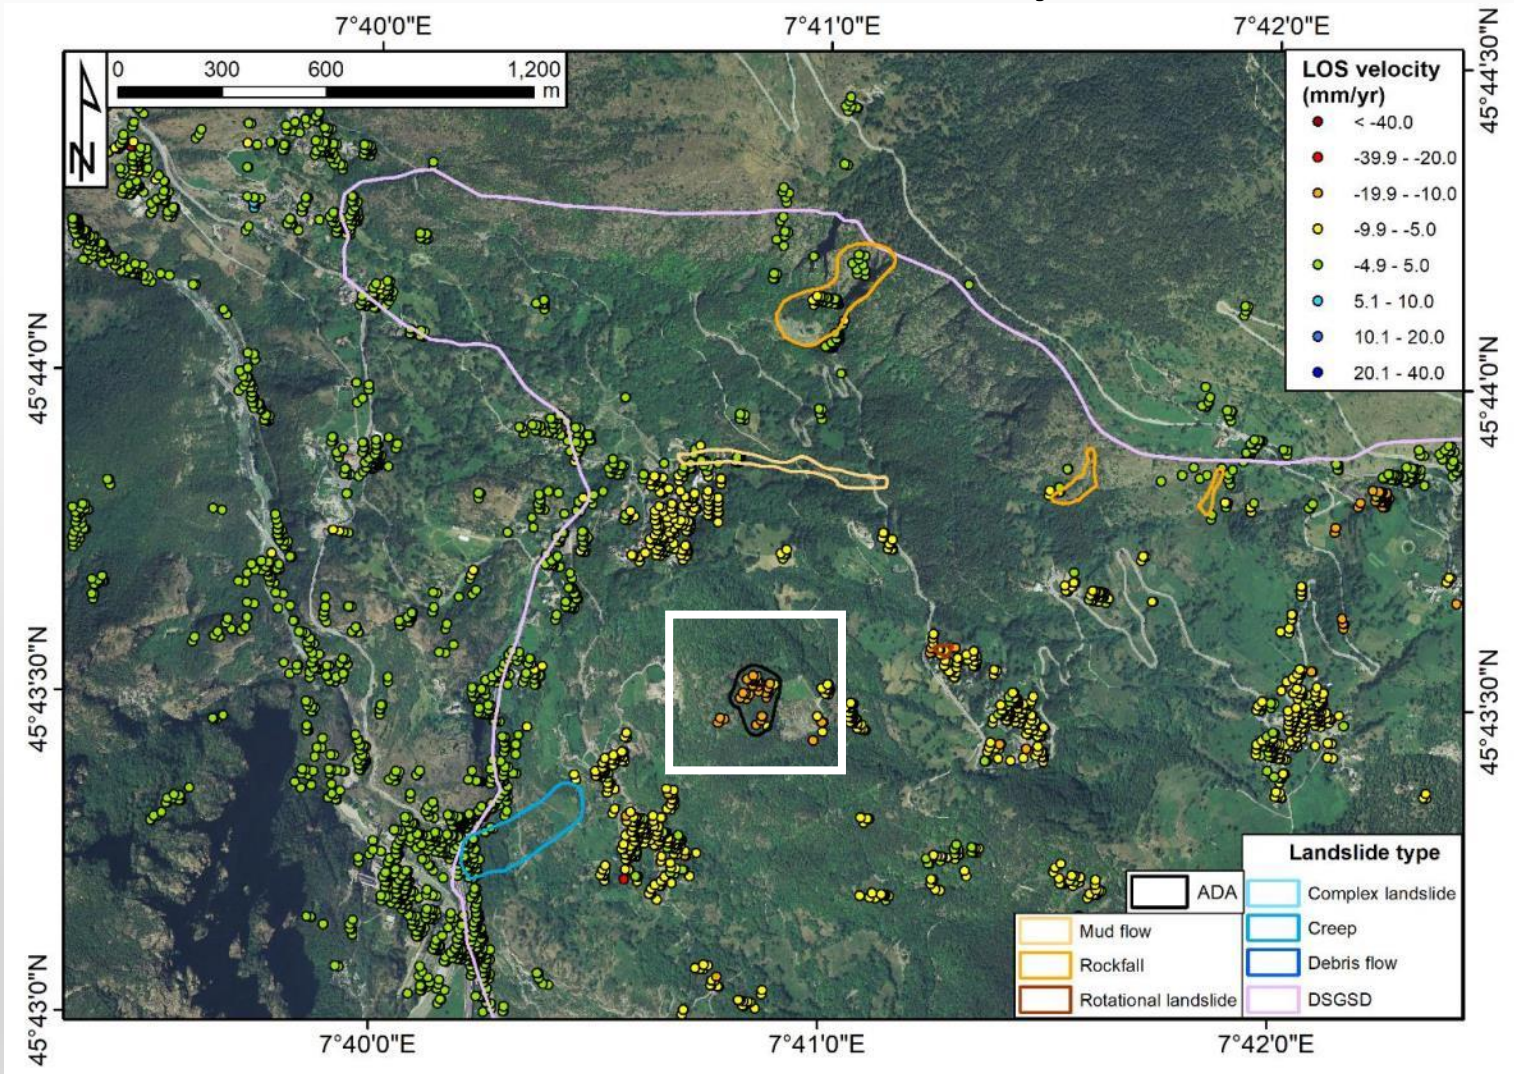

# ADA-related intensity (2)

The highest potential loss is 490 €/sqm for private houses

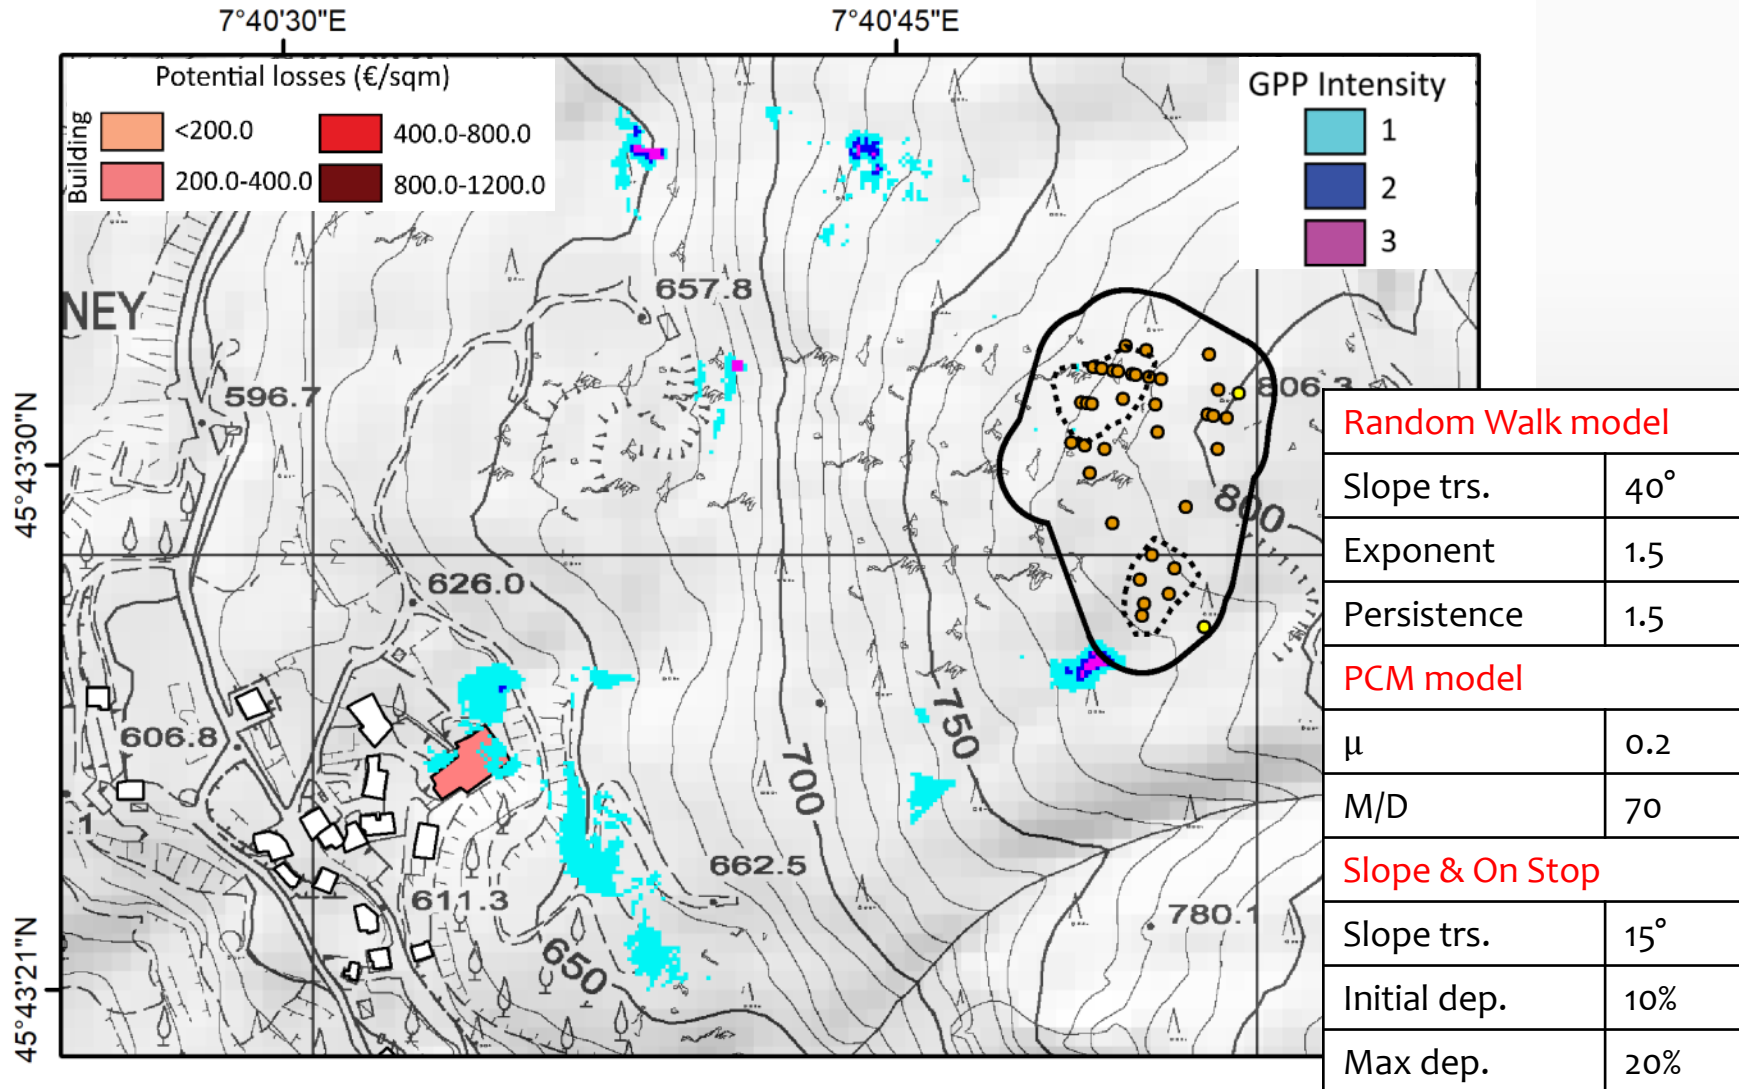

# Model-related intensity (1)

Ciseran village, Montjovet municipality. One ADA found within a debris area in a large DSGSD

# Model-related intensity (1)

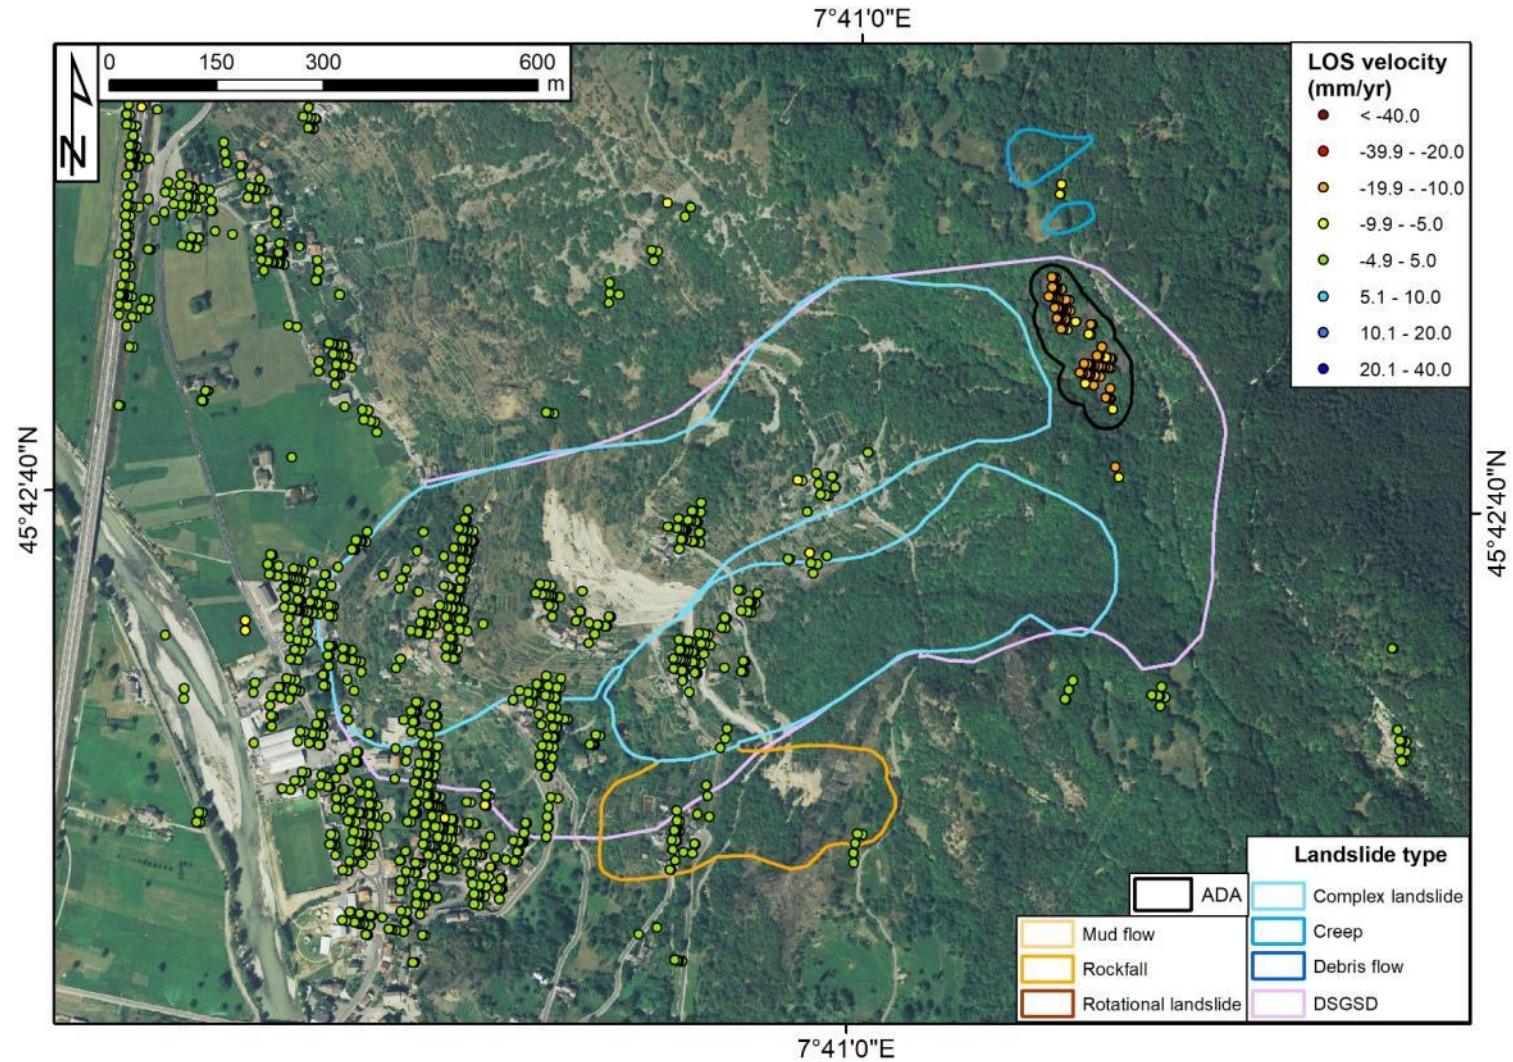

One private house could be hit by the debris flow with intensity 1.

$V=0.2$  and  $D=260\text{€/sqm}$

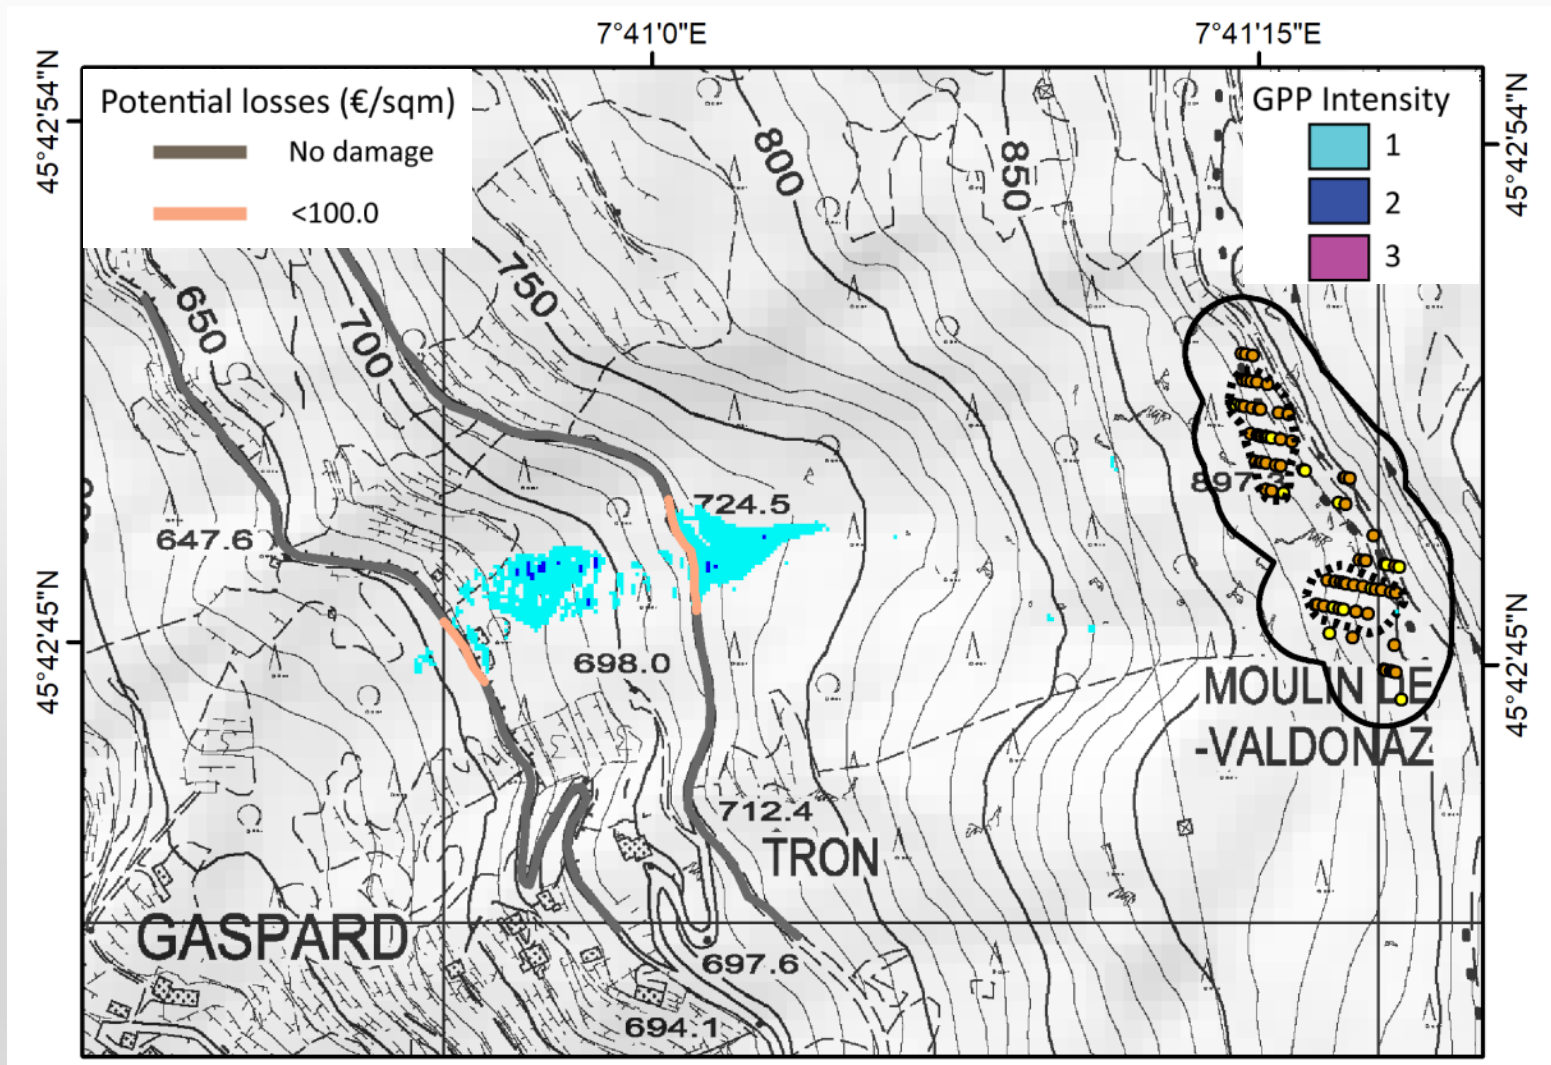

# Model-related intensity (2)

Tron village, Montjovet municipality. One ADA found within a debris area in a large DSGSD, crown area of 2 complex landslides

# Model-related intensity (2)

Two local roads could be hit by the debris flow with intensity 1.  $V=0.6$   
and  $D=30\text{€/sqm}$

# Final considerations

- We expand the concept of PS hot-spots, using them as input for “quantitative” damage estimation
- Interferometric data are here used for:
  1. ground movement hot-spots detection
  2. as landslide intensity tool (“ADA-related” approach)
  3. potential debris flow source areas detection (“model-related” approach)
- The methodology is designed for regional scale studies with few ancillary data available
- The methodology is designed for a wider exploitation of interferometric products, not only as mapping tools but also as instruments for preliminary risk estimation

# Limitations

- All the classical limitations of interferometric data (topography, snow, vegetation, fast motions...)
- Both vulnerability and exposure are estimated at medium to small scale. This is not a detailed scale analysis, it should be refined where possible
- The GPP model is a “worst-case” scenario forecasting, not a rheological model of a single phenomenon. So we can both underestimate or overestimate the reality
- No temporal occurrence information about the phenomena can be given, so it is not a quantitative risk analysis

# Sentinel-1 satellite monitoring system of the Tuscany Region

# Technological background

- a. Sentinel-1 is providing a continuous streaming of radar images free-for-all
- b. “Science-oriented” acquisition plan → no data lost
- c. Good compromise between acquisition band and resolution for regional-scale studies

- d. Algorithms and calculus power are ready to process over wide areas
- e. We already have the experience of previous “photographs” of entire nations
- f. New cloud-computing capabilities

velocity [mm / y] -5 0 +5

# The concept

Transition from static satellite analysis to dynamic monitoring of ground displacement

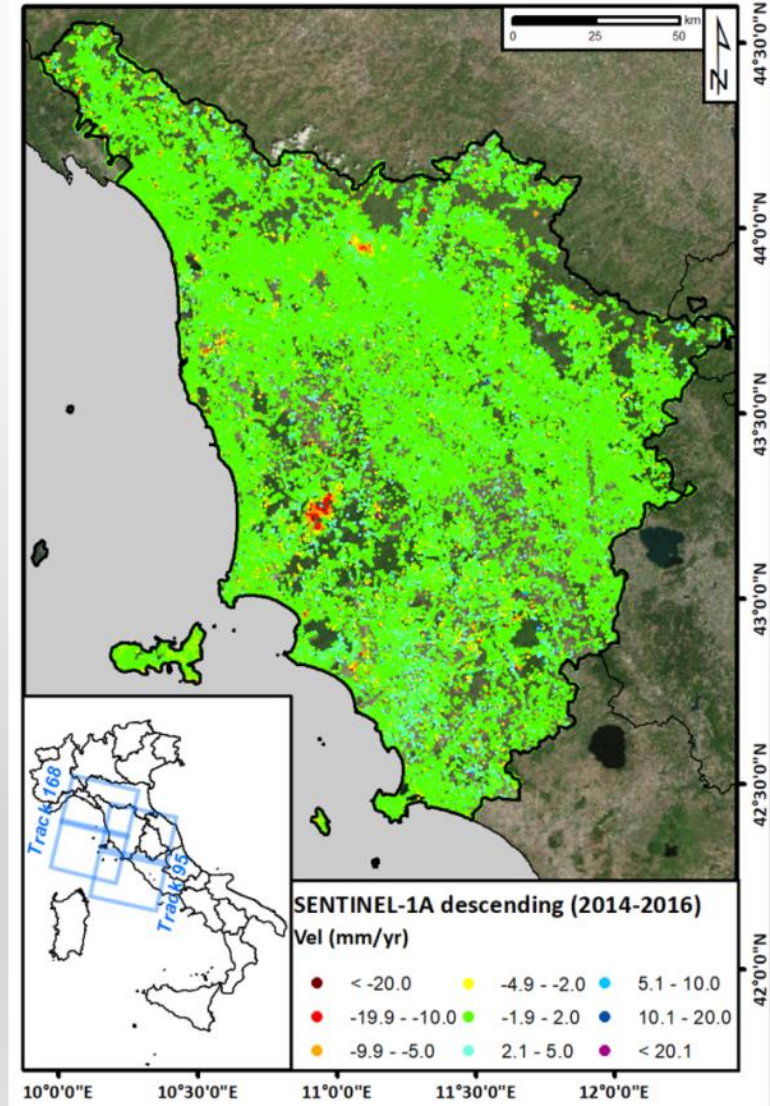

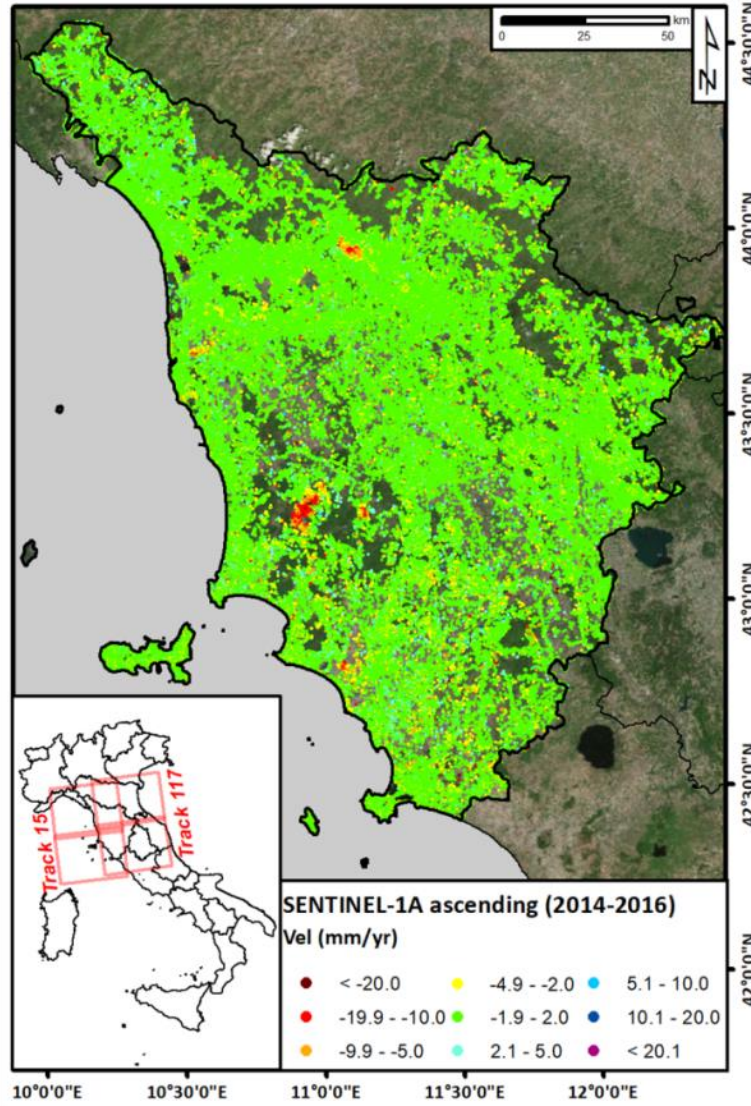

Transition from «one-shot» delivery to a continuous streaming of information

Systematic analysis of deformation time series, coupled with automatic tools for data mining and screening of large datasets

# Deformation maps

# Monitoring plan

71 updates of the project – almost 3 years of monitoring

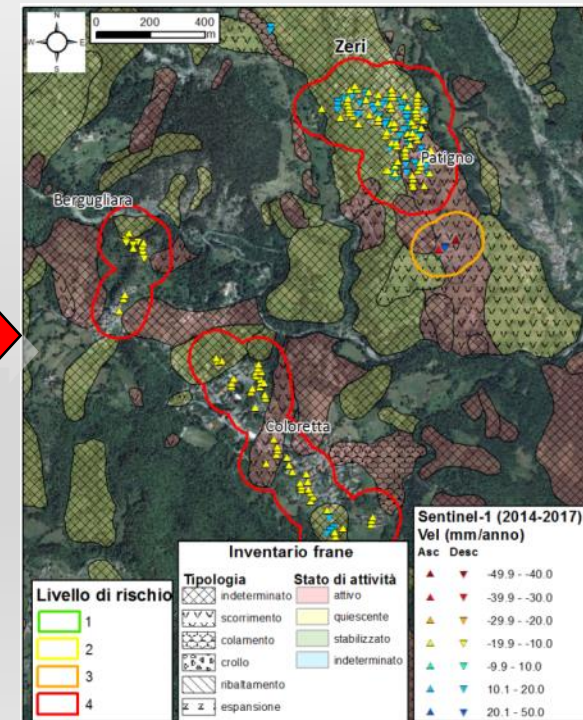

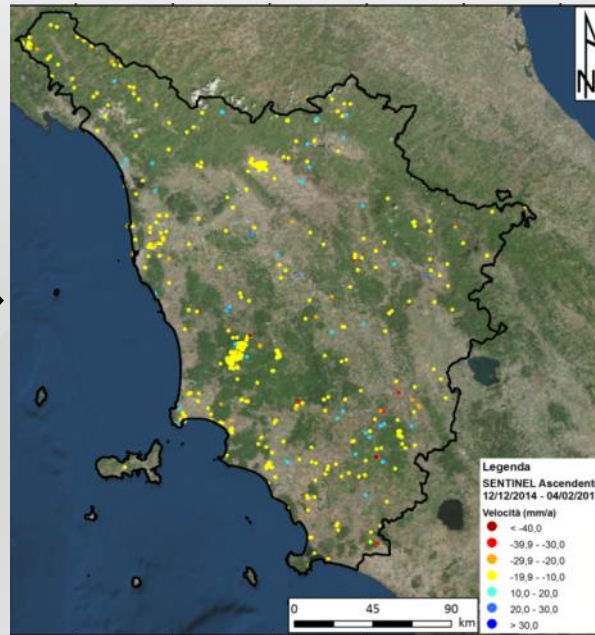

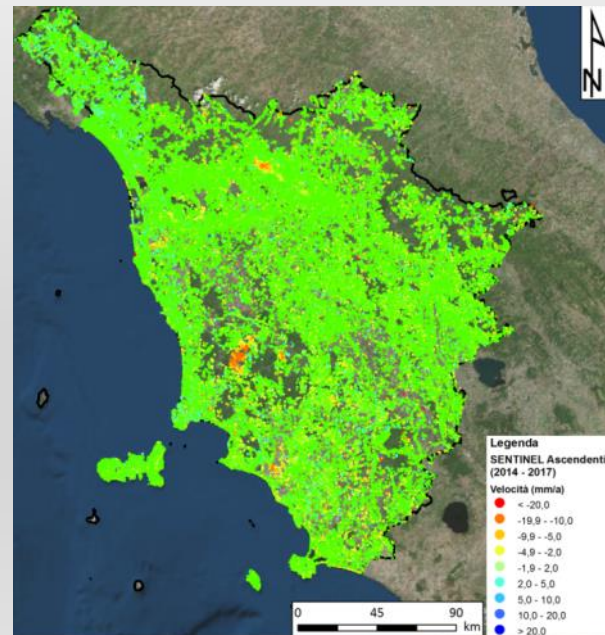

# Our activities

	PS Mapping	PS Monitoring
Typology	Single product	Continuous service
Time	deferred	«real»
Update	1 year	6 days
Purpose	Update of landslides inventory maps	Update of scenarios for geohazard risks

# PS Mapping

- It is based on the concept of ADA – Hot spot analysis
- We perform the analysis every year
- We classify each moving area on the basis of its possible triggering cause (mining, subsidence, uplift, landslide, geothermal activity)

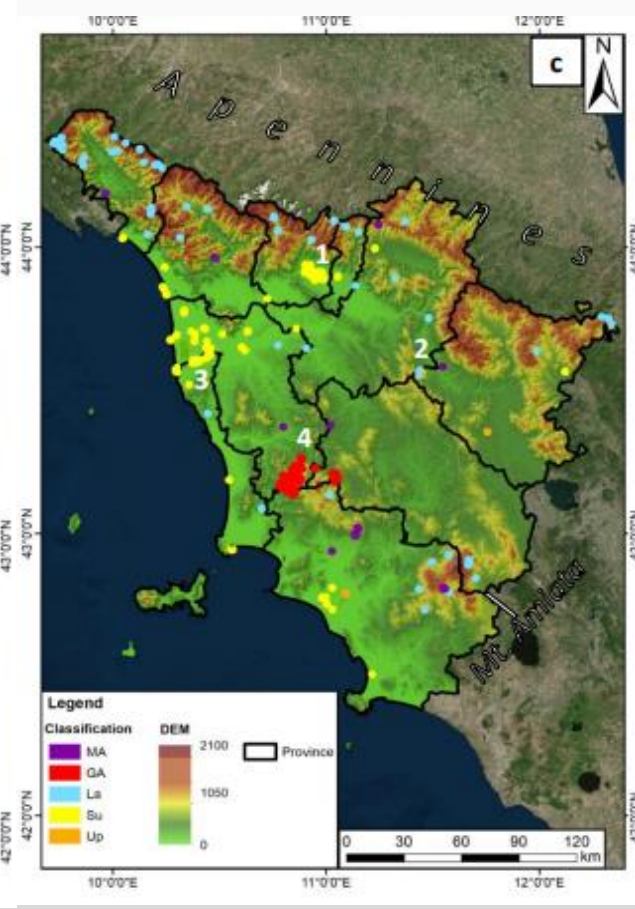

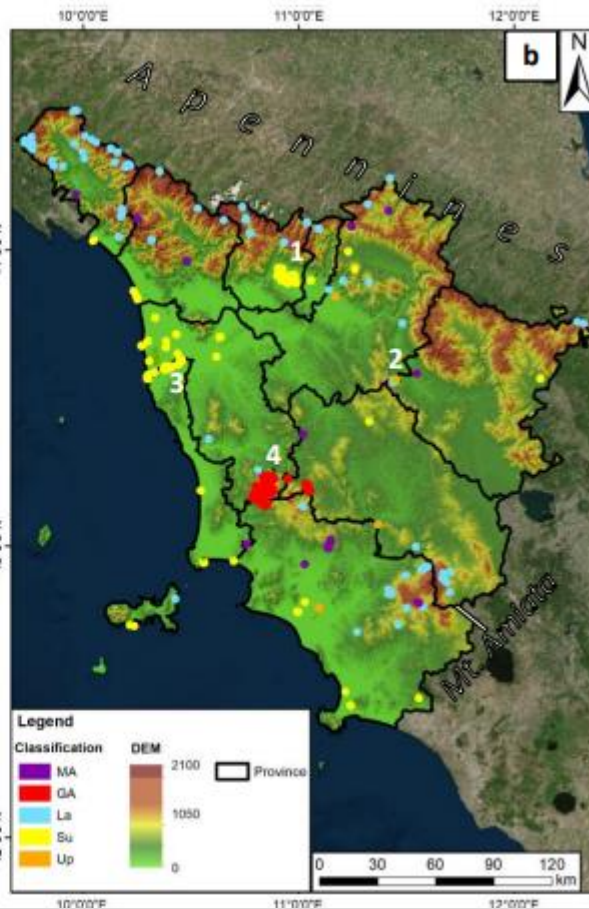

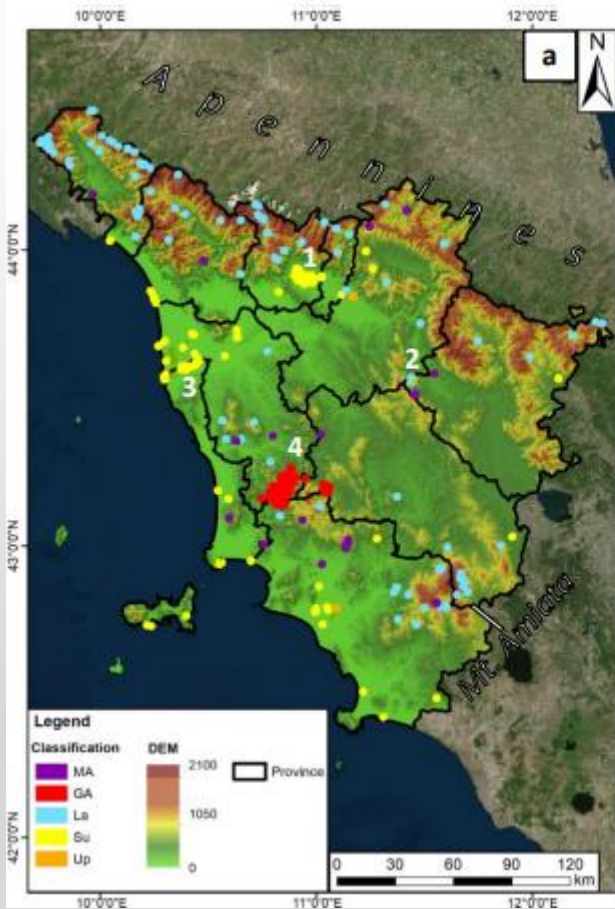

# Multi-temporal results

1<sup>st</sup> year

2<sup>nd</sup> year

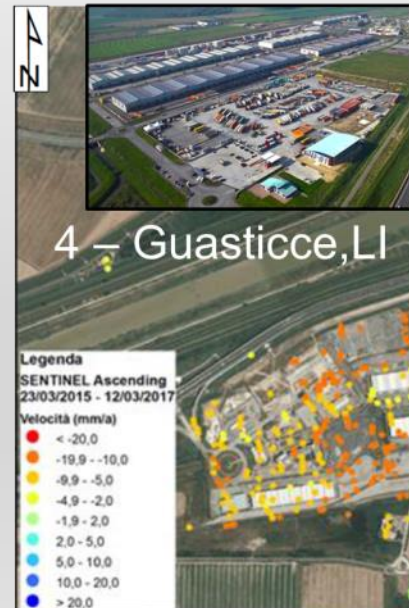

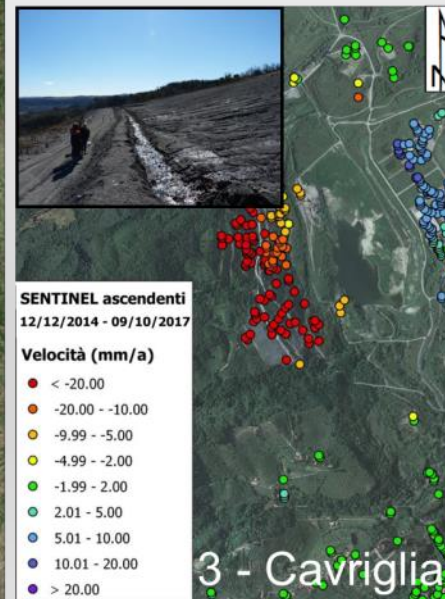

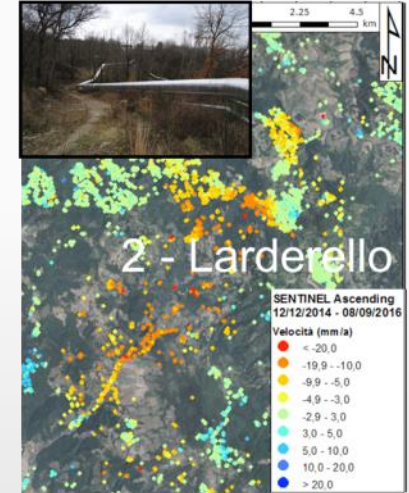

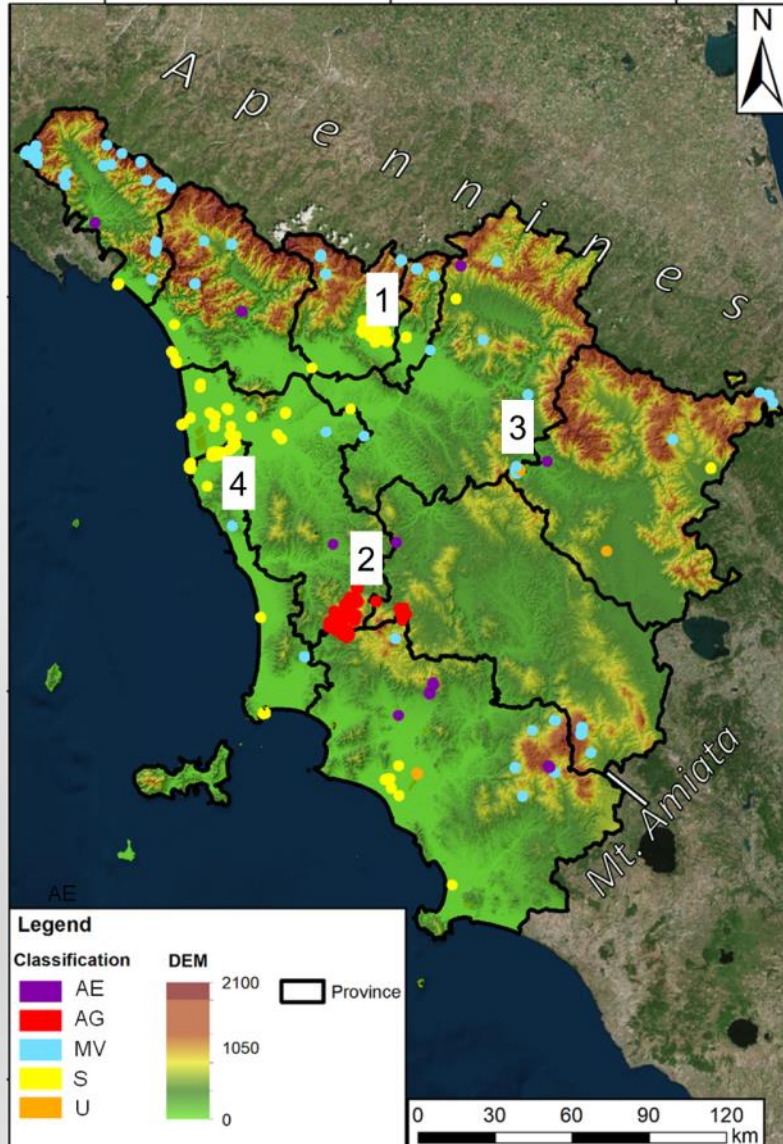

3<sup>rd</sup> year

The filtering threshold is 10 mm/yr

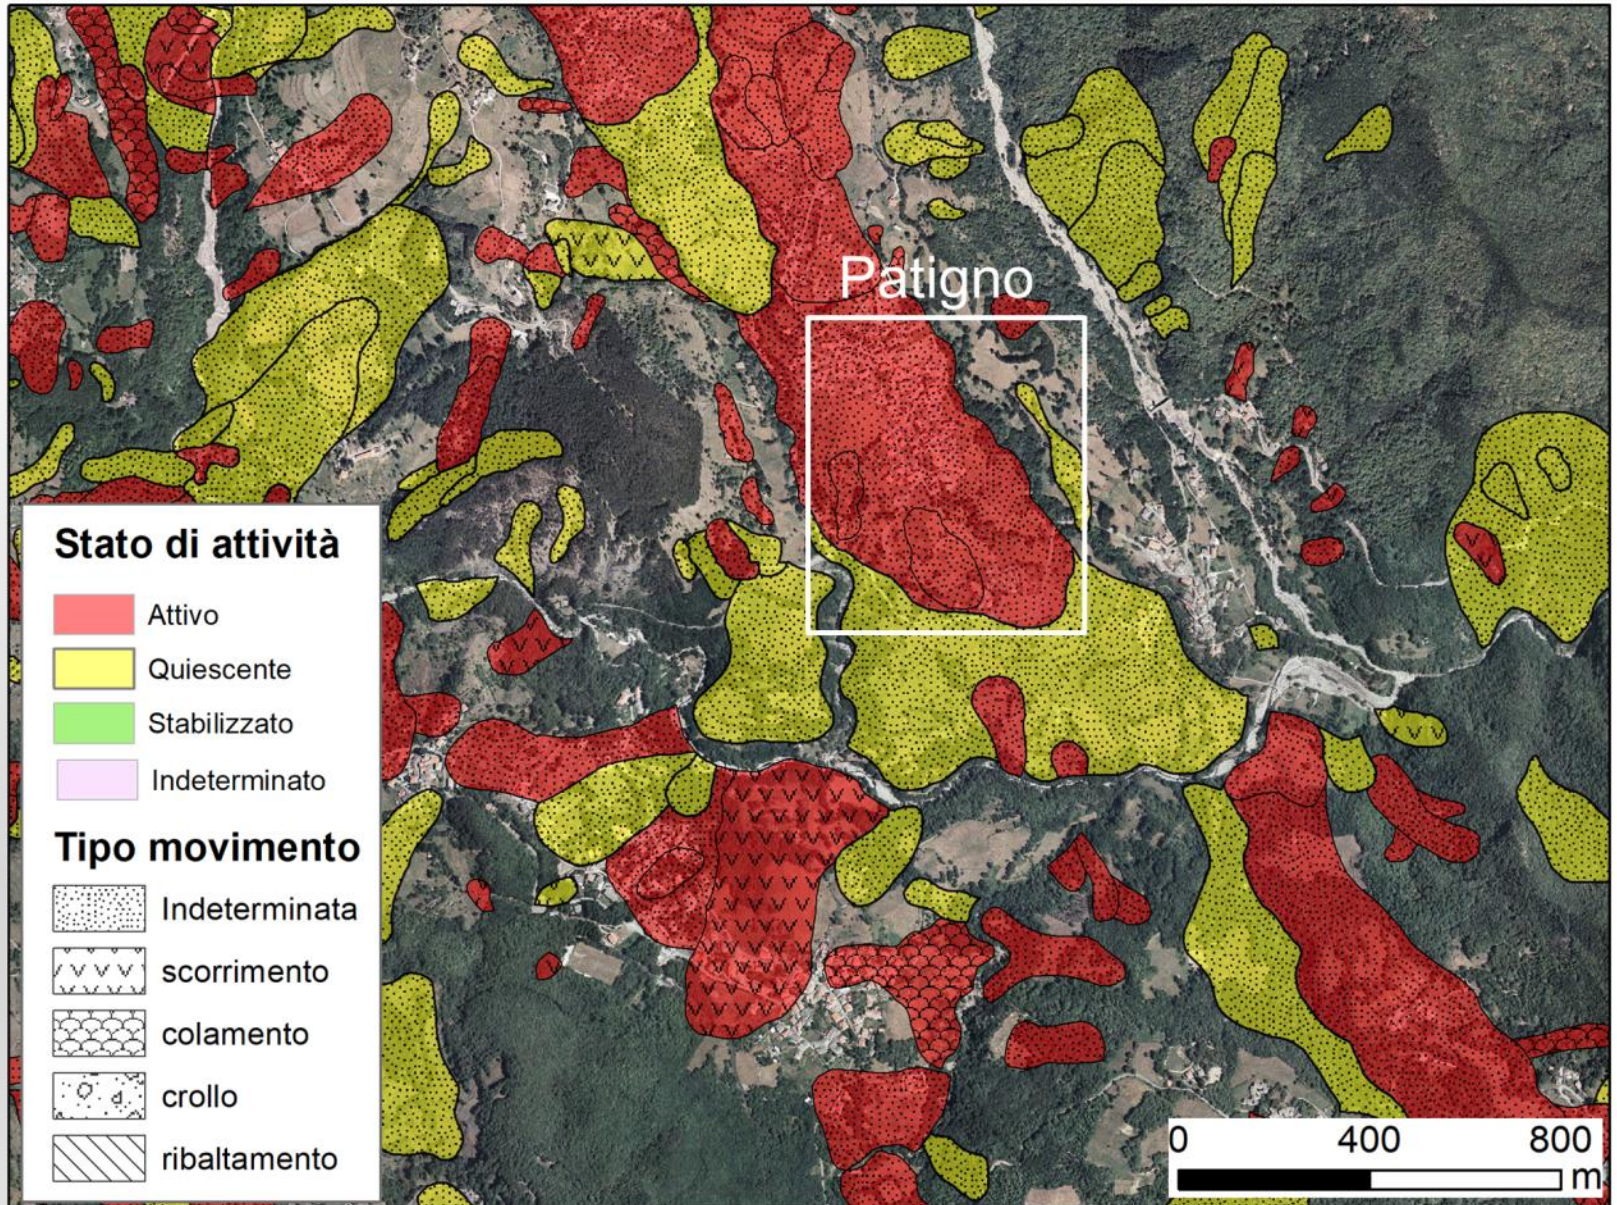

# Some examples

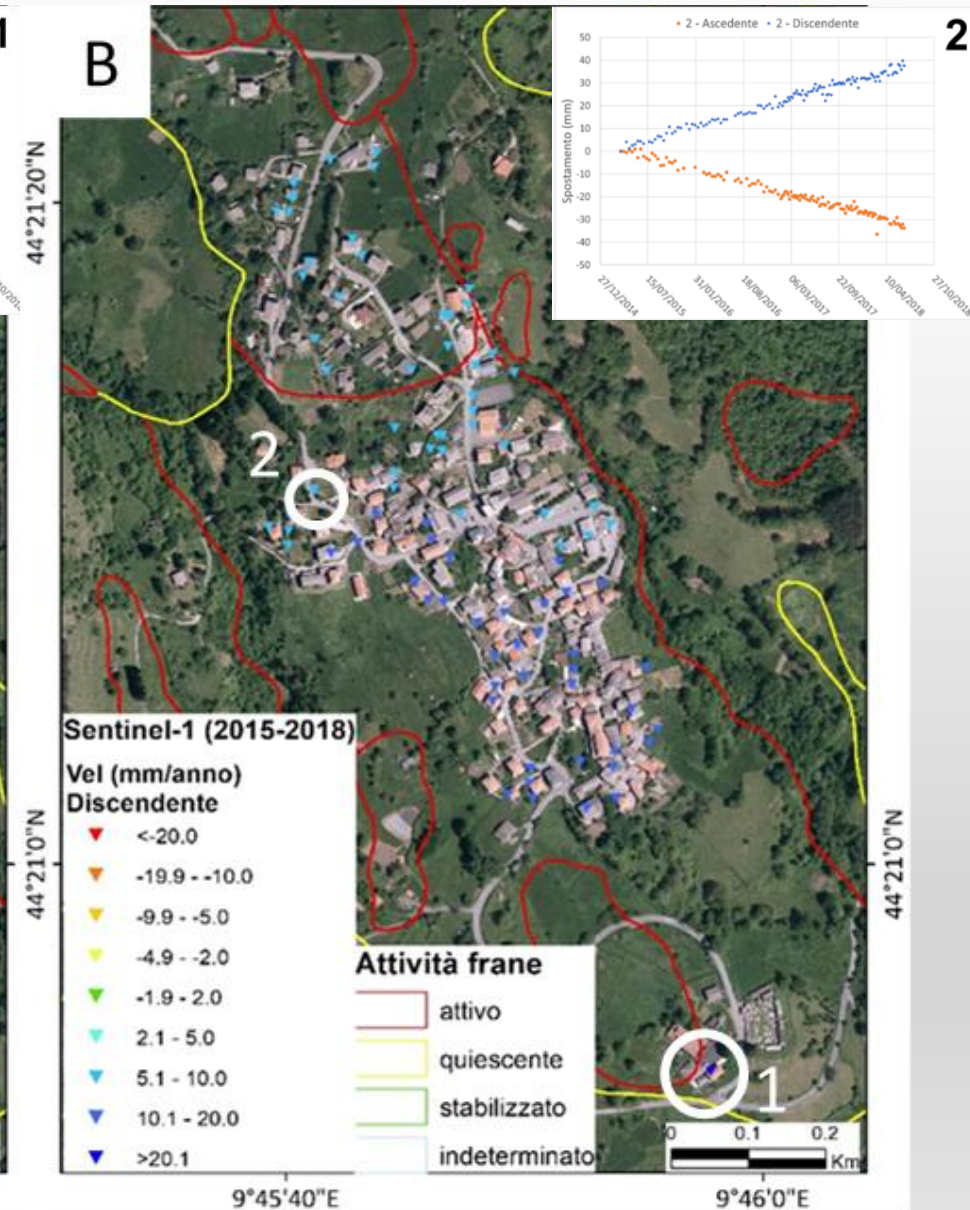

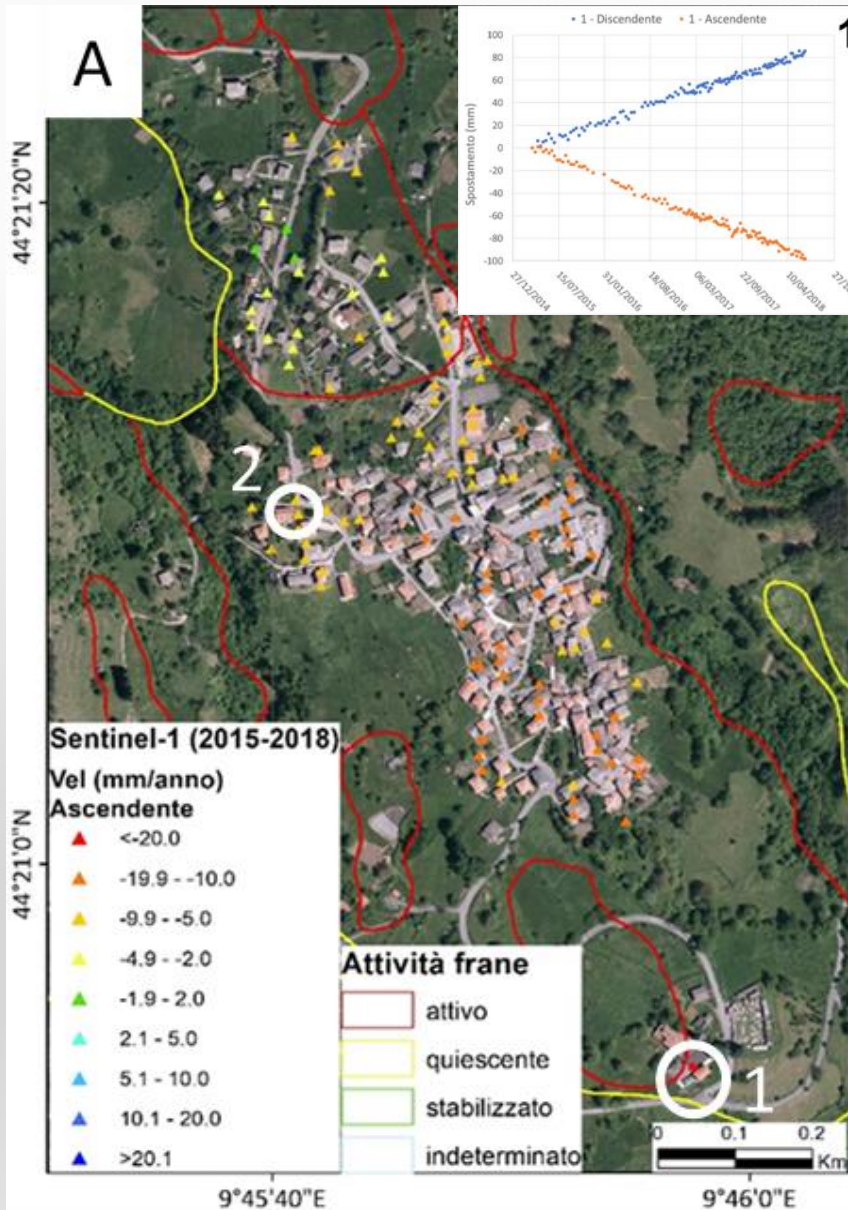

# Patigno landslide

# Patigno landslide

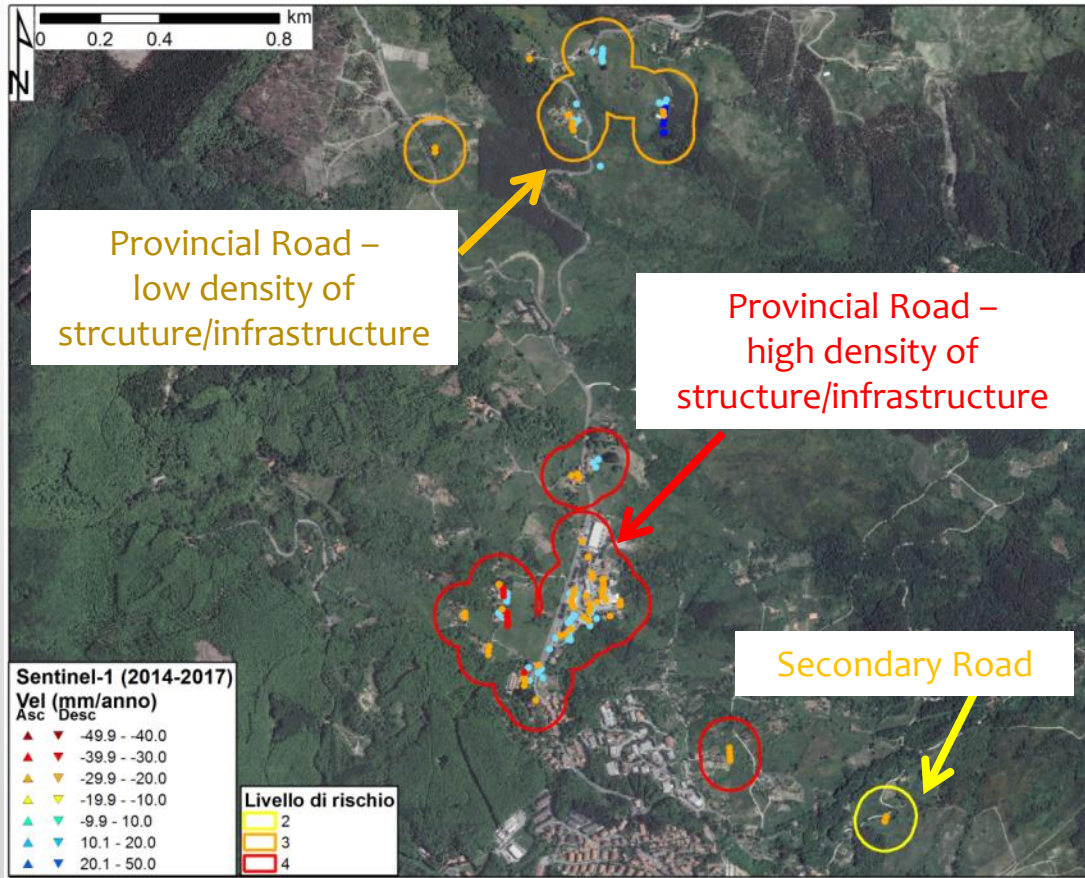

# Patigno landslide

# Municipality classification

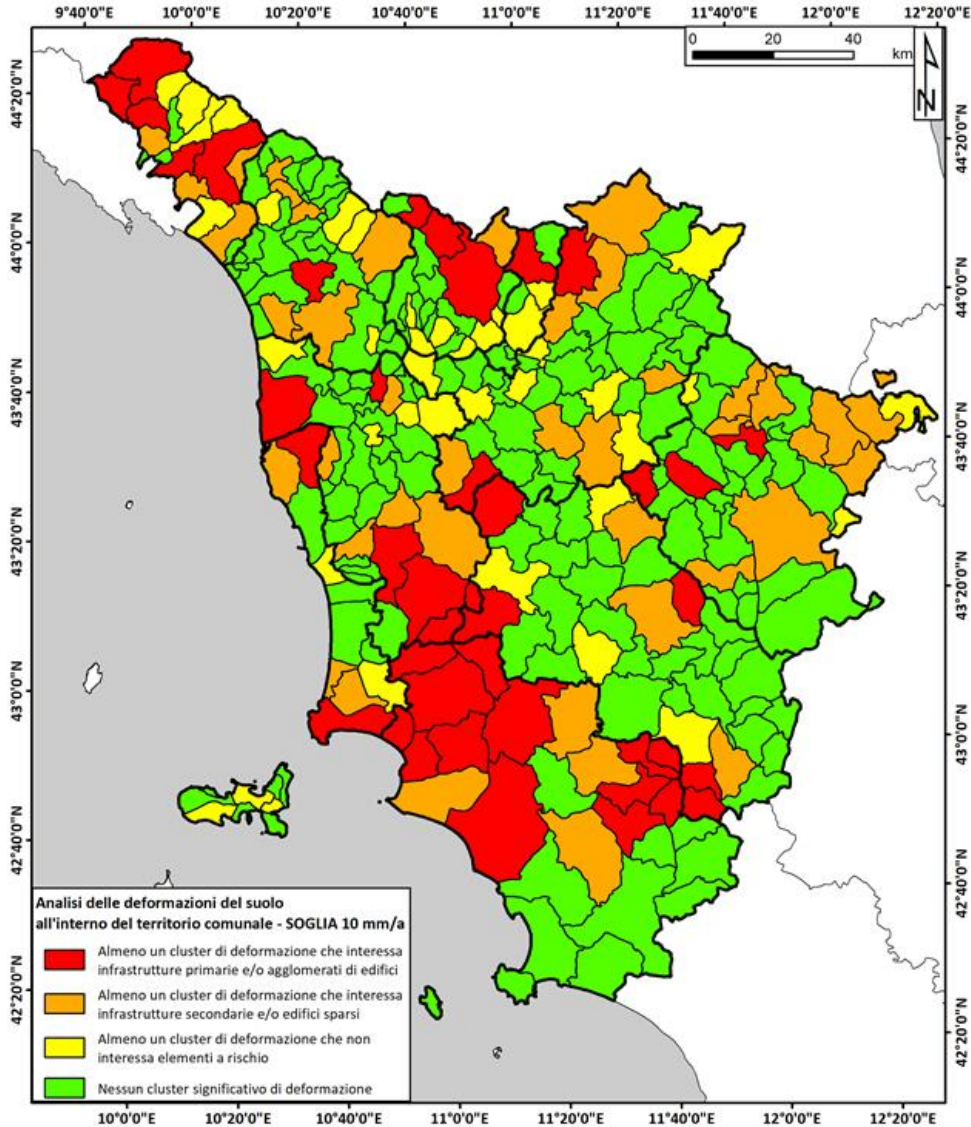

Class	Description
1	No relevant cluster
2	Isolated elements at risk (secondary road network, isolated buildings) within the clusters
3	Elements at risk (primary road network, isolated buildings) within the clusters
4	Several elements at risk (primary road network, villages, town) within the clusters

- Expeditious “risk” evaluation
- We only consider the type of element at risk – qualitative way

# Final product

Anomalies of movements

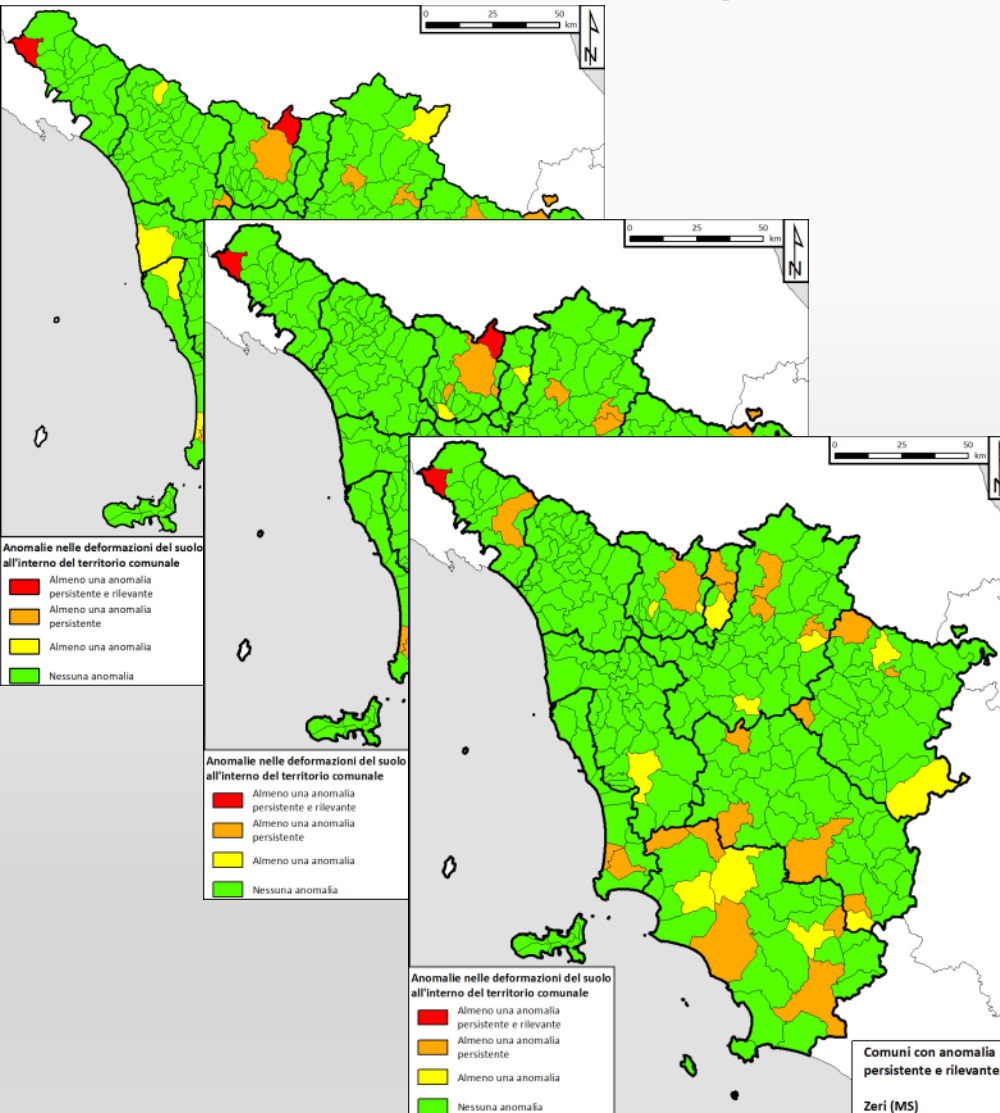

# Anomalies database

- Every 2 SNT-1 images a new processing is performed → new deformation map and new anomalous points
- The data are then interpreted and the database updated
- We define for each anomaly:
  1. cause (either if it can be true or not)
  2. temporal persistency
  3. spatial persistency

# Monitoring bulletin

Class	Description
1	No anomaly within the municipality
2	At least one anomaly within the municipality
3	At least one persistent anomaly within the municipality
4	At least one persistent and relevant anomaly within the municipality

The bulletin is sent to the end users the same day or the morning after the delivery of the satellite data

## BOLLETTINO DI MONITORAGGIO RADAR SATELLITARE DELLE DEFORMAZIONI DEL TERRENO DELLA REGIONE TOSCANA

Periodo di riferimento dal 24/04/2018 al 05/05/2018

**NOTE:** Per anomalie si intendono cambi di trend, variazioni repentine e/o accelerazioni nelle serie temporali di deformazione di punti di misura all'interno del territorio comunale.

### Sambuca Pistoiese (Pistoia)

Provincia	Comune	Località	Coordinate (WGS 1984 UTM Zona 32N)	Elemento a rischio	Causa	Persistenza
Pistoia	Sambuca Pistoiese (PT)	Carpineta	663011 E 4884116 N	Centri abitati, nuclei abitati e case sparse	Movimento di versante	3°, 4°, 5°, 6°, 7°, 8°, 9° e 10° aggiornamento

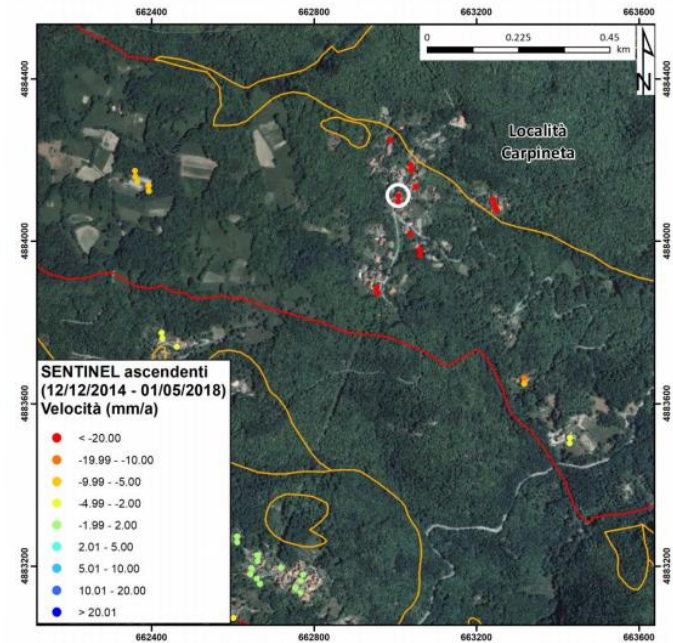

Figura 1 - Mappa di deformazione riferita all'area nel Comune di Sambuca Pistoiese (PT) in cui sono state registrate le anomalie nelle serie temporali. Il cerchio bianco si riferisce alla serie temporale riportata in Figura 2.

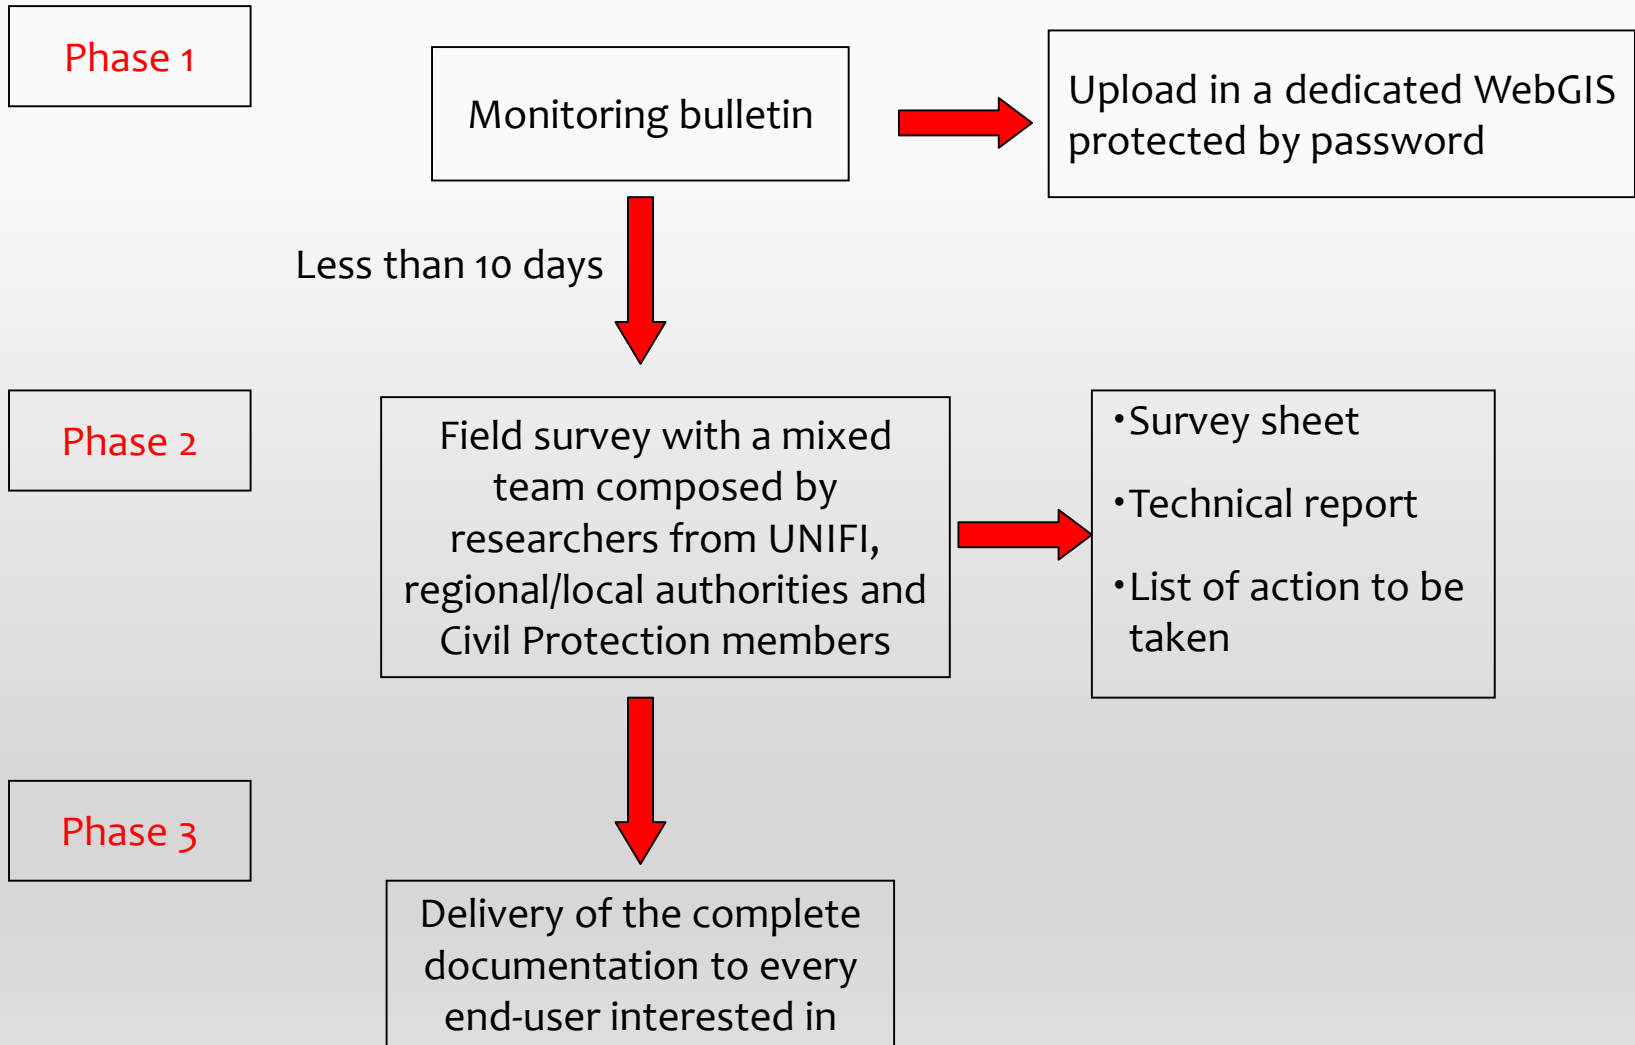

Figura 2 - Serie temporale di spostamento rappresentativa per l'area di indagine. Si evidenzia una nuova accelerazione a partire da febbraio 2018.

# Actions to be taken

R1	No particular precautions have to be taken.
R2	<ul style="list-style-type: none"><li>- Installation of extensimeters or crackmeters</li><li>- Systematic field surveys</li><li>- Conventional topographical monitoring</li><li>- Geo-engineering solutions</li></ul>
R3	<ul style="list-style-type: none"><li>- Installation of inclinometers</li><li>- Installation of piezometers</li><li>- Installation of rain gauges</li><li>- Detailed studies</li><li>- Environmental engineering techniques</li></ul>
R4	<ul style="list-style-type: none"><li>- Installation of GB-InSAR instrument</li><li>- GPS topographical monitoring</li><li>- Environmental engineering techniques</li></ul>

These are SUGGESTIONS, the municipality is not bound to any of these points. But if the local administration decides to take actions, it is a priority way to obtain regional funds

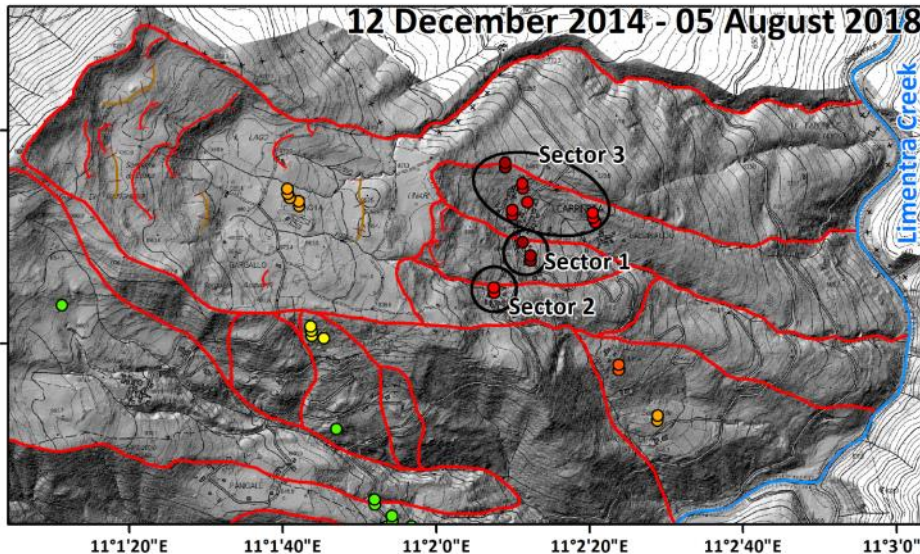

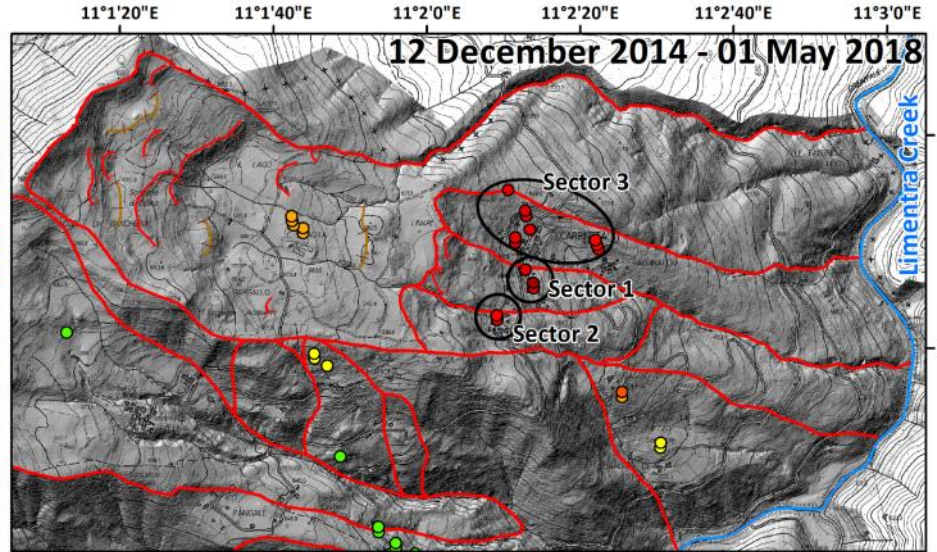

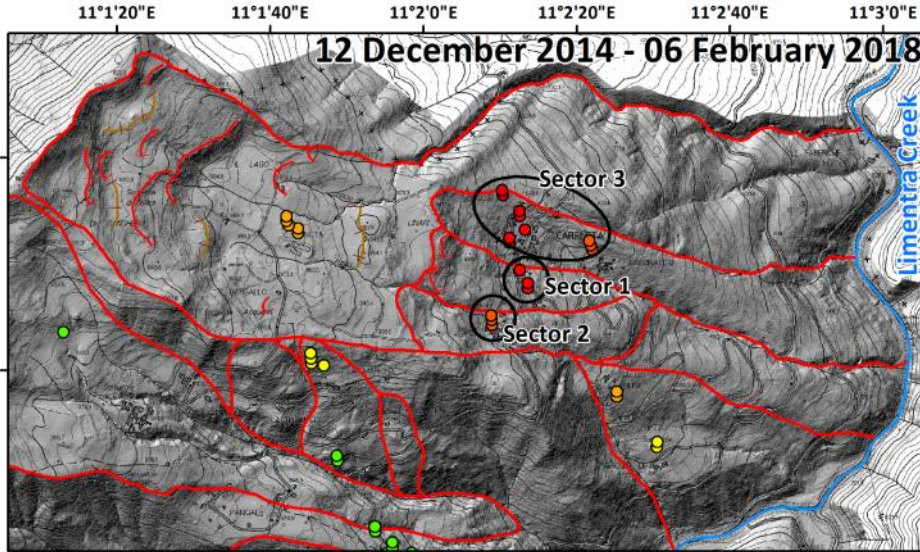

# Sambuca Pistoiese

# Sambuca Pistoiese - Acceleration

	12 December 2014 6 February 2018	12 December 2014 1 May 2018	12 December 2014 5 August 2018
Sector 1 Vel (mm/yr)	-24.6	-27.8	-30.2
Sector 2 Vel (mm/yr)	-19.4	-20.4	-22.1
Sector 3 Vel (mm/yr)	-23.9	-24.5	-26.4

# Sambuca Pistoiese – Time series

	Start of acceleration	Latency period	Appearance of anomaly	Disappearance of appearance	Persistency	Life length (days)
<b>Sector 1</b>	13/01/2018	4 acquisitions	06/02/2018	12/06/2018	126	150
<b>Sector 2</b>	12/02/2018	5 acquisitions	14/03/2018	06/07/2018	114	144
<b>Sector 3</b>	14/03/2018	3 acquisitions	01/04/2018	05/08/2018	126	144

# Sambuca Pistoiese - Survey

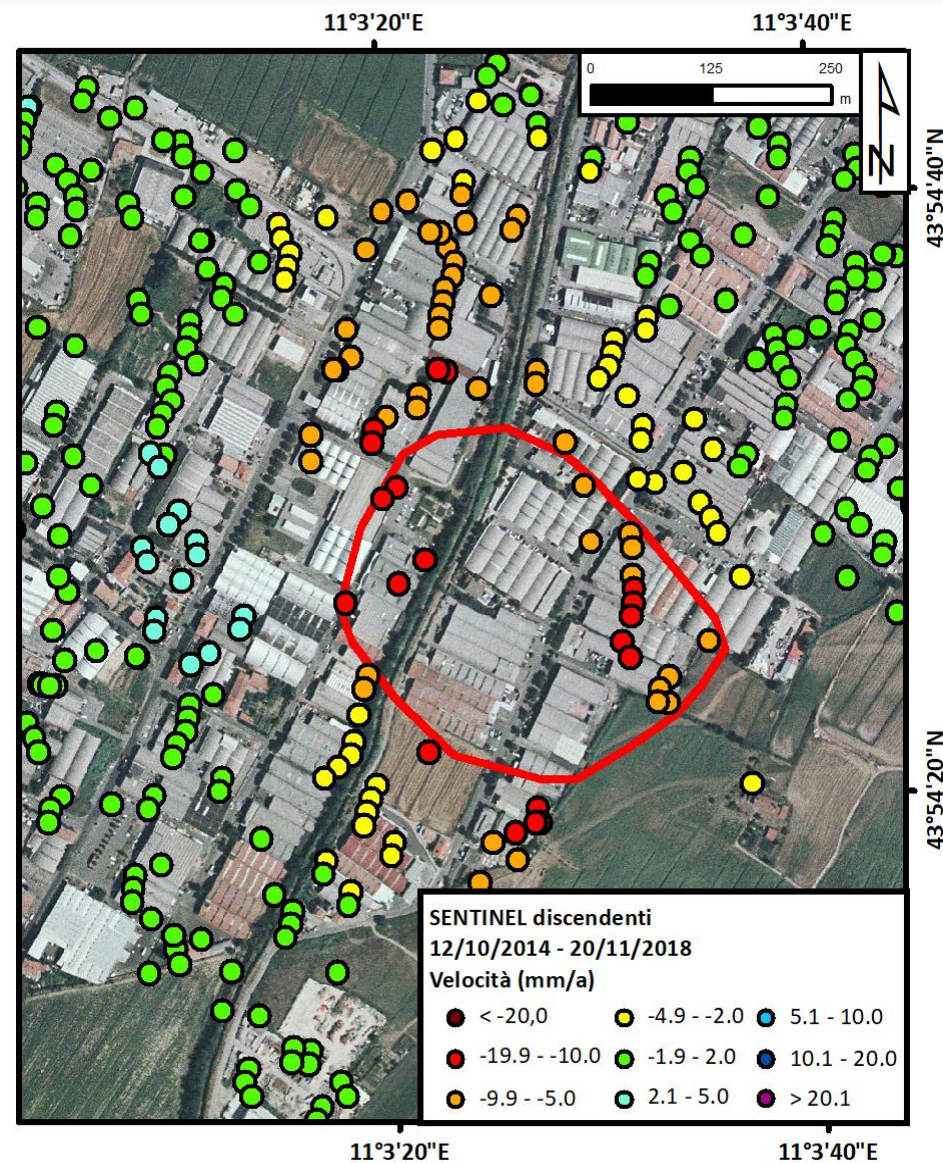

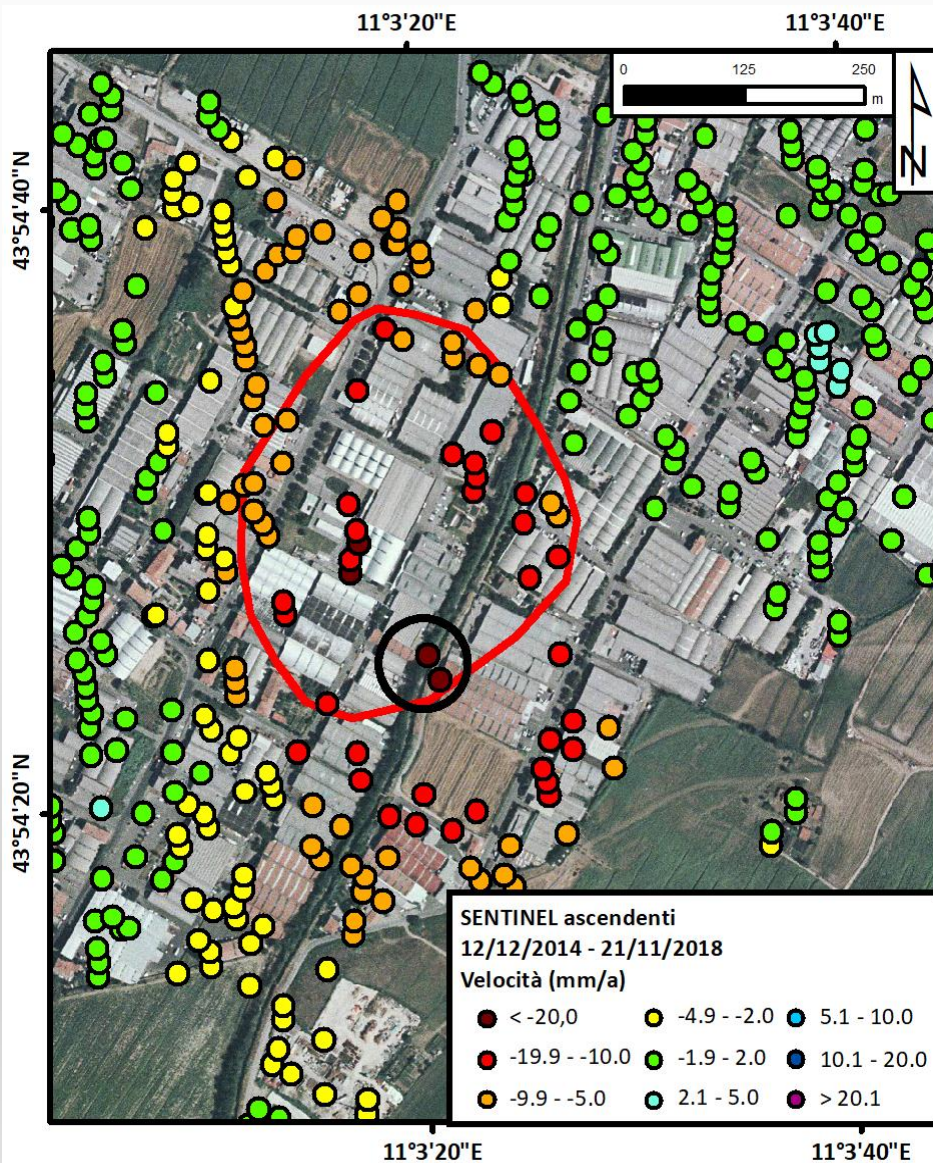

Further in situ investigations are needed to understand the landslide motion:

1. Boreholes
2. Inclinometers
3. Geotechnical parameters
4. Building fractures monitoring systems

# Montemurlo

# Montemurlo – Time series

Three acceleration periods related to the illegal activity of water extraction from a unauthorized well

# Montemurlo – Survey

Further in situ investigations are needed:

1. Hydrogeological parameters
2. Building fractures monitoring systems

# Actions taken

REGIONE TOSCANA

*Dirigente Responsabile Giancarlo COSTANTINI*

DODS2019PT0108	Studio fenomeno franoso individuato con anomalia da PS nell'ambito dell'accordo di Programma con UNI	COMUNE DI SAMBUCA PISTOIESE	PT	42475	€ 85.000,00	€ 85.000,00	€ 34.000,00	€ 34.000,00	€ 17.000,00		30/05/19	31/12/21
DODS2019PT0106	Studio mirato alla verifica di fenomeni di subsidenza rilevati da anomalia PS	COMUNE DI MONTEMURLO	PO	42475	€ 161.585,08	€ 161.585,08	€ 64.634,03	€ 64.634,03	€ 32.317,02		30/05/19	31/12/21

The Tuscany Region financed for a total of 246k€ additional geological activities Sambuca Pistoiese and Montemurlo.

# Dissemination of the results

We disseminate our results at different levels:

1. Scientific community: papers & conferences
2. Risk management entities (Tuscany Region – Geni Civili, Regional and National Civil Protection): periodic reporting, dedicated WebGIS (deformation maps + filtered/interpreted anomalies), bulletins, surveys
3. Municipalities: surveys results (including reports) and dedicated WebGIS (deformation maps ONLY)
4. Everyone (geologists, engineers, etc...): dedicated WebGIS (deformation maps ONLY) and courses

# Open WebGIS

- The download is free and everyone can access to the portal. The user can upload its own shapefiles if needed (i.e. an area of interest contour, a landslide, etc... )
- We prepared, helped by 2 lawyers, specific terms of service
- A guideline about the use of the data and how they can be used and interpreted is available in the website
- In the guideline, the user can also found a disclaimer and a list of “bad practices”
- The anomalies of motion are not delivered to the public, being a really advanced product (risky as well... )

# Courses

- We have already organized two courses (one in Firenze and one in Livorno) about the use of these data
- We start with the radar theory, giving to the technicians an overview on interferometric product and on how to read them

## ISCRIZIONI:

La scheda di iscrizione dovrà essere compilata ed inviata esclusivamente entro le ore 13,30 del 31 maggio 2019  
all'indirizzo: [admin-corsi@geologitoscana.net](mailto:admin-corsi@geologitoscana.net)

Segreteria Organizzativa:  
Ordine dei Geologi della Toscana  
Via Vittorio Fossombroni 11 - 50136 Firenze

**IL NUMERO MASSIMO DEI PARTECIPANTI E' 50**

**Al geologi:** Crediti APC richiesti (\*): 7 (con superamento test finale 10)

(\*): l'attribuzione dei crediti APC è decisa dall'OGT e validata dalla Commissione APC nazionale. È possibile che venga attribuito un numero di crediti diverso da quello richiesto

ORDINE DEI GEOLOGI DELLA TOSCANA

REGIONE  
TOSCANA

CON IL PATROCINIO DI:

IN COLLABORAZIONE CON:

Federazione Ing.Toscana

organizzano il SEMINARIO

## MONITORAGGIO RADAR SATELLITARE DELLE DEFORMAZIONI DEL TERRENO DELLA REGIONE TOSCANA

presso: sala convegni interporto toscano Amerigo Vespucci  
presso Palazzina Colombo uscita interporto ovest da SGC FI-PI-LI

COLLESALVETTI (LI)

3 giugno 2019

## Programma

Ore 8.45 – 9. 00

Registrazione dei partecipanti

Ore 9.00 – 9.30

Saluti e introduzione

Presidente Ordine dei Geologi della Toscana,

geol.Riccardo Martelli

Presidente Federazione Ingegneri della Toscana,

ing.Marco Bartoloni

Presidente Ordine degli Ingegneri Provincia di Livorno,

ing.Maurizio Malvalvi

Ore 9.30 – 11.00

L'interferometria radar satellitare: aspetti teorici e principi generali

Università degli Studi di Firenze

Relatori: prof.geol.Nicola Casagli,

geol.Matteo Del Soldato, dr.Lorenzo Solari

Ore 11.30 – 13.00

Il monitoraggio radar satellitare: analisi ed interpretazione dei dati

Università degli Studi di Firenze

Relatori: prof.geol.Nicola Casagli,

geol.Federico Raspini, dr.ssaSilvia Bianchini

Ore 13.00 – 14.30 – pausa pranzo

Ore 14.30 – 15.30

Il sistema informativo e la rappresentazione dei dati LAMMA (in attesa di conferma)

Relatori: dr.Bernardo Gozzini, dr.Lorenzo Bottai, dr.Riccardo Mari

Ore 15.30 – 16.30

Protocollo di utilizzo dei dati del Monitoraggio Radar satellitare delle deformazioni del terreno in Regione Toscana

Regione Toscana

Relatore: geol.Vania Pellegrineschi (in attesa di conferma)

Ore 16.30 – 17.00

Tavola rotonda

Regione Toscana, geol.Vania Pellegrineschi

Ordine dei Geologi della Toscana, geol.Riccardo Martelli

Ordine degli Ingegneri di Livorno, ing.Maurizio Malvalvi

Università degli Studi di Firenze, geol.Federico Raspini

Lamma, dr.Bernardo Gozzini

Ore 17,00 – 18,00

TEST DI VERIFICA

# Final considerations

- Image availability & computational power allow rethinking the concept of PS data for “one-shot” mapping activities
- In the Tuscany Region the system is now fully operative. It was not easy to tune but we start to obtain good results
- A key factor to correctly manage the amount of data is the constant exchange of information with regional and local entities
- The end users must have an active role in the dissemination of the results
- The dissemination itself requires precise guidelines and rules to avoid misinterpretation and uncorrect usage

Thank you  
for your  
attention
